rtists began traversing into the unique possibilities of electronically-generated music in the

20th century to produce unheard musical textures and amalgamation of different sounds.

EARLY DAYS

We can credit French composer, Edgard Varèse, as the pioneer of Electronic music in many ways. He built electronic instruments in the 1920s and delved into experiments with tape loops during the 50s. Varèse's work inspired John Cage, an American composer and Karlheinz Stockhausen, a German composer. Both of them significantly increased the wealth of compositional structures which could incorporate electronic

devices, thereby increasing the scope of this, at the time, unconventional music form. However, Russian musician, Leon Theremin, could also be regarded as the pioneer in this field, since he created the 'Theremin' in the 1920s which could generate electromagnetic fields that could create sounds at different pitches when the musician moves his/her hands over the theremin. Two decades later, in the 1940s, magnetic audio tapes allowed musicians to record sounds and then

modify their speeds or direction. This led to the creation of electroacoustic tape music in Egypt and France in the 40s. However, electronic music didn't really come into prominence until the 70s. This can be credited to synthesizers and sequencers becoming more accessible and affordable.

The progressive rock band Pink Floyd featured the iconic Moog synthesizer, which first released commercially in the 1960s, as one of the important elements of their sound. Even The Beatles, a pop rock band, began incorporating synthesizers into some of their more experimental tracks. However, it was the German bands such as Kraftwerk and Tangerine Dream that actually introduced this style of music to the masses and popularised it. Kraftwerk pioneered the idea of pop music being played exclusively on synthesizers and developed a robotic, hypnotic style which influenced almost all electronic pop music produced in the remainder of the 20th century.
