music band, Daft Punk, began using electronic instruments soon after to capitalise on the inflating disco music trend which had heavy electronic elements. In the 80s, synthpop, dance and other genres were born out of the emergence of electronic music and the invention of bass synthesizers and drum kits.

THE SYNTH ERA

Synthpop came into being sometime in the 80s which was the era of glitz and glamour. This was a great time for electronic music, with styles like synthpop and house coming into existence. A new technology called MIDI (Musical Instrument Digital Interface) was created which allowed the connection of electronic devices like synthesizers, samplers and computers, that make and control sound. They communicate with each other using MIDI messages. Trance was also a by-product of the increasing influx of electronic music and technological developments. In 1982, Charanjit Singh, a synthesizer and guitar player, recorded an album called Ten Ragas to Disco Beat, which had Indian ragas performed on synthesizers in sync with machine

the hippie influx during this time. This music form embraced the mystical properties of Indian music and culture and imbibed elements of trance and electronica into it. Their style is less turntable-oriented since vinyl melts in heat. This caused moving away from turntables and using DATs instead, or in some cases, playing beats faster since the vinyl melted so quickly, resulting in very high rates of BPM (beats per minute). The British sound system known as 'Return to the Source' brought Goa Trance to the world by releasing three volumes in a compiled series of 'best trance music on the scene'.

During this period, hard rock bands like The Sisters of Mercy also embraced electronic music and used MIDI effects and drum machines to create new types of music genres like dark wave and alternative dance. The word 'dance' pops up here and the rest is history. Bands like Orbital solidified the foundations for dance music genres like techno and trance. Additionally, the rise of computer usage in homes like the Atari ST also introduced MIDI technology to a wider audience of music producers. Electronic

sounds, by the 90s, had gone through a lot of evolution and after successfully achieving commercialisation, producers as well as composers started experimenting with techno sounds that propelled it into the mainstream, commercial music scene.

songs were all the rage and many artists witnessed that the remixed 'electronic' version of their song was more popular than the original track itself. The odder the beat and especially, the drop, the better the response from the masses who enjoyed grooving to beats. In India, artists such as Nucleya, Anish Sood, Kerano, Lost Stories, Sartek and more are constantly attempting to bridge the gap between indie electronic music and commercial music and some of these bands are doing this quite successfully.

EDM era was and still is a force to be reckoned

Genres like dubstep and trance influenced the structure of mainstream pop music during this time. All the popular artists, even today, implement some aspects of dubstep, house or trance to their singles to give them the 'edge'. Despite electronic music entering mainstream music, many iconic electronic artists still persistently produce music aimed towards the niche, underground audience and not the mainstream audience. The Internet has also played a vital role in the growth of electronic music owing to the popularity of social media and other websites like YouTube and SoundCloud which has allowed electronic music to spread even further.

Over the last 40 years, electronic music has transformed from an underground niche to a mass phenomenon and it continues to grow rapidly every day. The underground scene, which is still alive and kicking, grows with every passing day as well, with newer technology making it easier to create unique, unheard of sounds that take audiophiles and electronic music fans by surprise even now. 

MIDI controllers allowed various electronic musical instruments to be connected together

rhythms of the TR808 and 909. In the Indian context, smash-hit Hindi disco songs were also produced during this time, with 'Disco Diwane' becoming a longstanding hit in South Africa and some other countries. The cult native disco creations of Bappi Lahiri and Usha Uthup also became popular. This was also the time when 'Goa Trance' gained popularity, which specifically originated on Anjuna Beach owing to

EDM ERA

Iconic artists like Tiësto and David Guetta have collaborated with mainstream artists and created popular dance tracks. With the advent of the new millennium, there was a kind of fusion that transpired which led to the world of 'feats'. Using electronic sounds along with popular music artists and their vocals became increasingly common. Remixed versions of
