

SHOWCASE

Cowboy

Cowboy is an e-bike company that, until recently, only sold in Belgium but are now making the move to other countries. The company has taken their time getting the bike and its pricing right in Belgium before deciding to make the move to the international market. The e-bike comes with its own app, which can be used to track the bike should it be stolen. It's got a Bluetooth beacon, which can help narrow your search down even more once

you're in the right location. You require this app to lock and unlock the bike as well, and also to turn the lights on and off. The app automatically reports the health status on the bike frequently, and will alert you if it thinks there are any problems. The bike only has a single gear and the power is determined by the force used on the pedals. Cowboy uses the latest Samsung 21,700 Li-ion battery, with a range of 70km. It takes 3 hours to charge fully.

Fluid Inside Helmet

The Fluid Inside helmet basically function on the same premise as our own heads do. It attempts to emulate the human skull which protects our brains from any kind of external damage. Our brains have a thin layer of liquid around them which protect them from otherwise dangerous, or even fatal, impacts. Even during light falls, our brain matter actually slams into the sides of our skulls. The fluids surrounding our brains effectively help in minimising the trauma that is caused because of the impact and in turn keep the insides of our brains safe.

Fluid Inside's helmet takes this exact same approach. Inside the helmet you will find something called the Fluid Pod. A matrix of pods line the inside of the helmet and they are filled with a liquid that closely resemble cerebrospinal fluids. The same stuff that's around our brains. These pods act as an additional buffer that absorb impacts and minimise trauma to the head, therefore mitigating the impact of the fall as much as possible. The pods are also placed strategically, and work as a system. They're ineffective on their own, but as part of a system, they can greatly decrease risks of trauma.

Kano PC

Kano is an education startup that makes build-your-own PC kits for children. The startup has paired up with Microsoft to help kids make DIY touchscreen laptops that will run Windows 10 S, a lite version of Windows 10.

In terms of looks, the DIY laptop looks like a Surface PC, with a 11.6-inch display latched on to a keyboard case. The Kano PC features a transparent back that reveals all of the modular pieces in use inside the computer. The whole idea is to enable and encourage the habit of 'tinkering around' in children.

Prior to this, Kano's DIY kits were powered by the Raspberry Pi 3 and used Kano's own OS. The Windows-powered DIY touchscreen PC will be powered by a 1.44 GHz Intel Atom x5-Z8350 quad-core processor, will host 4GB of RAM, with 64GB expandable storage via microSD card. There's also an HDMI port, a headphone jack, mic, two USB ports, WiFi and Bluetooth support.
