

Playdate

Panic, a company otherwise known for making software, have come out with their very first piece of hardware, and it's a handheld console. A really small one, with only two buttons on the front, a dpad, and a crank.

Dubbed the Playdate, it is a bright yellow, handheld console featuring a monochrome screen. Meaning it's only in Black and White, but don't let that deter you. The black and white is minimalistic and actually aesthetically-pleasing. It

gives the device some personality as well. The games that are being developed for this nifty little device, are done keeping this look in mind.

Like we mentioned above, the device also features a crank on the side, something like the kind you would usually see on fishing rods. This is sort of a first when it comes to the world of consoles,

so it'll be pretty interesting to see how they integrate it with the supported array of games. It's a unique concept and we can't wait to see the fun integrations.

The Playdate, however, is still in the works, but there are already games being made for this tiny device. Additionally, dedicated team is continuously working on perfecting the device before its final release. As of now, we have no official release date for the Playdate.

Varjo XR-1

The Varjo VR-1 is a VR headset that costs a whopping \$6000. The exorbitant price tag is thanks to a pool of features including retina-perfect rendering of 3D models and eye-tracking, among others. But that's not what we're concerned with, we're looking at the upgrade, the Varjo XR-1, which is a mixed reality headset, that takes things to the next level.

Now we know what you're thinking, mixed reality means something like the HoloLens, so projecting images in the real world, right? No, the Varjo XR-1 is worn like a proper VR Headset and projects the outside world using dual 12-megapixel cameras. It does this with latency so low that Volvo uses the headset while driving cars!

The passthrough cameras kind of make the Varjo XR-1 sit comfortably in a category of its own. With the VR-1 costing \$6000, don't expect the XR-1 to be any cheaper.

Bose NCH 700

After the overwhelming success of the Bose QuietComfort 35 or QC35, the company has now come up with the NCH 700 or Noise Cancelling Headphones 700. These headphones, according to reports and the company, may be the best headphones to make and receive calls on. Why? There are a whopping eight microphones on the NCH 700. Two of the eight microphones are used to pick up whatever you are saying, while other six work together to reject or cancel any other noise. Of those six, two microphones work in a partnership to

detect loud sounds around you and suppress these sounds.

The NCH has adjustable settings for how much of the world you actually want muted out. It ranges on a scale from 10 to zero. At zero, you can hear pretty much all ambient sound (sounds in your surroundings). In fact, it's better than ANC because the mics actually work to bring you all the sounds. So, you can't block sounds out accidentally just because you were wearing headphones. At 10, ideally, you shouldn't really be able to hear anything at all.
