Samsung The Wall Luxury

The Wall Luxury is the latest from Samsung's expandable microLED-based TVs. These TVs can scale from 73-inches and 2K, which is already pretty big, all the way up to a whopping 292-inches and 8K definition with their 'The Wall Luxury'. To give you an idea of how big that is, that's 24 feet diagonally. 24 feet! It's like having your very own, personal movie theatre (if you have a decent sound system, that is). The Wall Luxury by Samsung was introduced at Infocomm 2019.

This huge TV, despite its size, has a depth of only 30mm. So it's incredibly thin. On top of that, it sports a completely bezel-free design. It's got the specs to match its size as well, with Quantum HDR technology – which is an AI for picture quality, a peaking brightness of 2000 nits and a refresh rate of 120Hz.

Calling this TV massive is an understatement to say the least since it is large enough to completely cover an entire wall. Samsung has come up with a rather interesting way to utilise the massive screen even when it's not in use with its Ambient Mode. When Ambient Mode is in use, the TV essentially turns into a piece of art, displaying an art installation of the user's choice.

There's no info on the pricing of this beast yet, but judging from the \$100,000 price of the 98-inch Q900 8K TV, we're not even going to bother guessing what The Wall Luxury will cost. We can probably buy one if we sell a kidney... no, 10 kidneys.

Porsche 891 Bergspyder

It's not uncommon for Porsche to come up with cool concept cars, they do it quite often. It's also not uncommon that some pretty amazing concept cars never make it to production. One such concept car is the 891 Bergspyder. This was a working prototype made by Porsche back in 2015 that never saw the light of day. The car was made to celebrate the 50th year of the iconic Porsche 909 Bergspyder. The 909 was a lightweight, one-seater speedster that weighed just 847 pounds. It is to date, Porsche's lightest car, and was used for hill climb races.

Like the 909, the concept 981 is also a roofless one-seater. It draws inspiration from the original Bergspyder and uses a similar colour scheme as well, with the same sporty stripe design. Unlike the 909, the 981 weighs a lot more at 2,423 lbs. That's because it was made for modern times and roads. The prototype holds a 3.8-litre flat-six engine. The 891 can do 0-100 km in a little over four seconds! The 891 Bergspyder may never have made it to production, but it will be making its appearance at the 2019 Gaisberg Hillclimb race this year. After that, it'll head back to the Porsche museum.
