WHAT'S NEW

Apple to obtain majority of Intel's smartphone modem business for \$1 Billion

In just months after shutting down its smartphone modem business, Intel has entered into a deal with Apple to sell the majority of its smartphone modem business. The deal will also see 2,200 Intel employees joining Apple along with IP, equipment and leases. Post finalising this deal, which is supposed to happen later this year,

Apple will solidify its wireless technology patent portfolio which will become 17,000 strong. These include patents covering cellular standards, modem architecture and modem operations. Patents pertaining to non-smartphone applications such as IoT, PCs and autonomous vehicles will be retained by Intel.

Facebook's laundry list of new regulations

Facebook's \$5 billion fine wasn't the only highlight of the FTC verdict pertaining to the Cambridge Analytica scandal. The FTC has also imposed a list of regulations on Facebook. It requires that Facebook exercise greater oversight over third-party applications and to terminate app developers that fail to certify with policies or can't justify the need for user data. Facebook will no longer be able to use

the phone numbers which were obtained for 2-factor authentication for advertising

purposes. User's consent has to be sought prior to using any user data that is not covered in a previous disclosure and a

clear notice should be provided whenever Facebook uses facial recognition technology. Facebook is now prohibited from asking email passwords of other services when users sign up for FB services. It has to establish, implement and maintain a comprehensive data security program. And lastly, it has to encrypt user passwords and regularly check if passwords are stored in plaintext.
