

Big O gaming PC

Origin PC has built a monstrous PC that has a built-in Xbox One X, PS4 Pro and Nintendo Switch.

Autocomplete for coding

A new AI-powered tool, TabNine, can now autocomplete your code and speed up the process. <https://dgit.in/aug19-36>

Name your app

Click on it and click on the button that says "Add a bot". Your bot entry should be added to your application now. You should see a button to Copy the token for your bot. Copy it and save it in a text file for later.

Now, install Node.js (<https://dgit.in/nodejs>) on your PC. We opted for

the LTS (Long Term Support) version which at the time of writing this article was version 10.16.0.

ADD YOUR BOT TO YOUR SERVER

If you haven't created a server on discord, then you might want to do that before proceeding with the following steps. Once you've created a server, you should proceed with adding your new bot to your server. To do that, take the following URL and switch out the phrase CLIENTID which the string of numbers that you had saved from earlier. Then paste the URL into a browser tab and press enter to add the bot.

https://discordapp.com/oauth2/authorize?&client_id=CLIENTID&scope=bot&permissions=8

Add the bot to your server

You should hear a chime that indicates a new joinee and the bot should be visible in the users panel on the right when you're viewing the server.

Bots can only be added using OAuth2 and you need to specify the permissions argument in order to give your bot certain abilities. In this case, we've given it permissions="8" which basically allows the bot to send messages. If you want your bot to manage channels, then you will have to give it permissions="10" for that to happen. A complete list of permissions values can be found here - <https://dgit.in/permissions>.

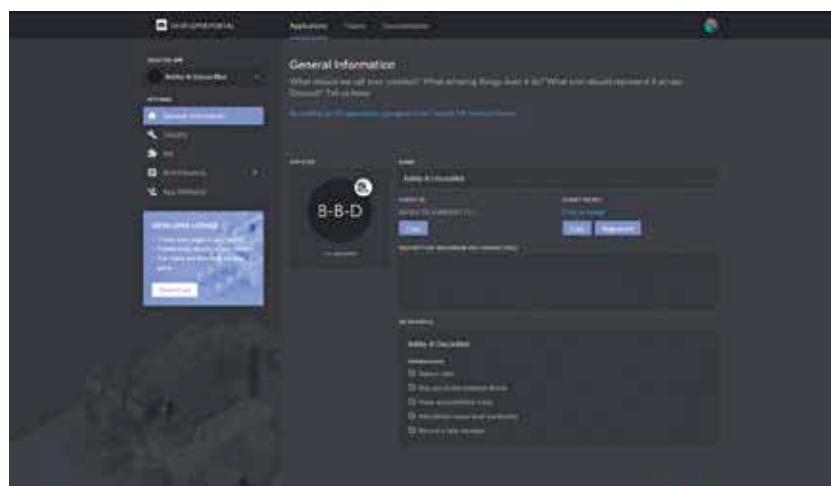

GETTING YOUR BOT TOGETHER

First, create a folder and name it anything you want. Inside it, create a new text file called "auth.json" with the following line where the phrase 'bot_token' is replaced with the token that you had obtained from the Discord bot creation page.

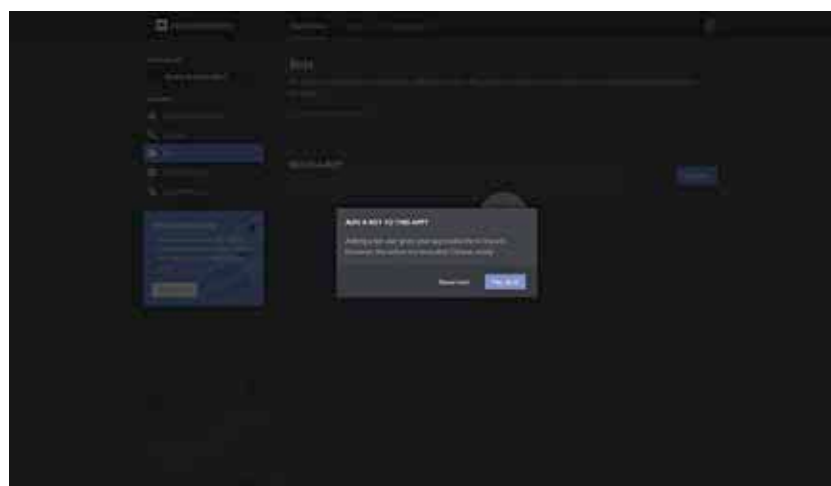

```
{
  "token": "bot_token"
}
```

Create another text file called package.json and add the following lines to it:

```
{
  "name": "Bobby-B-DiscordBot",
  "version": "1.0.0",
  "description": "Bobby-B is the Fury",
}
```

Homepage of the app

Add a bot - Click on "Yes, let's do it!"
