

**Redesigned Fold coming soon**

Samsung has made "improvements" to protect the Galaxy Fold's screen. Sales should start in September. <https://digit.in/aug19-25>

**Apple to release 3 new iPhones**

The iPhone 11, iPhone 11 Max and iPhone XR successor are expected to launch around September. <https://digit.in/aug19-26>

5 tech jobs for the next decade

Tectonic shifts in technology mandate a slew of new, currently non-existent jobs and the proliferation of a couple of oldies but goldies

Dhriti Datta | dhriti@digit.in

W

ork has always been central to humans for millennia gone and millennia to come.

However, the nature of work itself is highly dynamic since it needs to evolve constantly to suit the times we live in. In technology at present, when we think of the hot

words, Artificial Intelligence (AI), Machine Learning (ML), Blockchain, IoT, and big data instantaneously come to mind. It wouldn't be incorrect to assume that the technology jobs of the next decade will inevitably revolve around these buzz words that are changing the way people live their lives, consume content, and go about practically everything. The amassing belief, however morbid it may seem, is that technology is increasingly

flooding the enterprise and this will cause machines to eventually take over all the jobs.

Contrary to popular belief, AI and ML will actually create more jobs for humans than they take away, as stated in a recent Cognizant report. However, what the fast-paced development of AI, ML and other technologies will do is that it will change the kind of work we are employed for. A report from the Turing Centre mentions that these technologies will automate some jobs entirely (although not as many as one would expect) and the productivity gains as a result of this, will result in a host of new jobs emerging. It is entirely possible to stray too far down
