

RED blames ODM

RED blames ODM for the poor camera on the first phone. A second RED phone is on the way. <https://digit.in/aug19-27>

Messenger redesigned for web

The Messenger app got a design overhaul for Android and iOS, which is now coming to the web app. <https://digit.in/aug19-28>

Trash data could be a goldmine

this path and land into the realm of science fiction (a lot of science fiction will not stay sci-fi forever too), but a more grounded approach brings some interesting, new tech jobs to the surface as well. Also, other jobs, that are already present but not all that prevalent, may see a major boost in the next decade. Let's look at 5 tech jobs that will most probably be big in the next decade.

DATA TRASH ENGINEER

Some data could have not been used for months or even years. Some data may not be needed for any kind of regulatory processes. Some data may have absolutely no foreseeable use regardless of what was initially thought. However, it's all still data and data is still important. The idea behind junk data is often wrong, and we need to fix it, according to Cognizant. All this 'junk' data can be turned into meaningful insights if cleaned properly. This is where a data trash engineer comes swooping in. To rescue all the junked data.

Data trash engineers is a technology job that isn't present as of now, but organisations are already looking into hiring data trash engineers owing to the astounding amounts of data that is collected worldwide. A data trash engineer will be needed to identify unused data in the organisation they are employed, clean the 'junk' data thoroughly and feed this cleaned data into machine learning algorithms that generate all sorts of hidden insights. In this manner, the amount of meaningful data collected is increased and the data quality also ends up improving. Ultimately, a data trash engineer has one goal - turn trash data into treasure. It's the era of big data and it will probably be the era of big data in the next decade as well, therefore, this job can be a potential long-term employment source.

VIRTUAL IDENTITY DEFENDER

The internet is dark and full of terrors. Every corner you look, you will find fake news looming around. Unless you're living under a rock, you will know that there are new technologies that can literally put words in people's mouths. Yes, we're talking

about the terrifying world of deep fakes and the eerie accuracy of many of them. While the narrative around them has been staggeringly comedic, this technology poses very serious threats that could very well be apocalyptic. Even though several apps and other technologies are getting much better at spotting them, deep fakes are constantly evolving to become much better too, so a dedicated job to address this threat is probably the best way to deal with them.

Enter the 'virtual identity defender'. At least, that is what the Cognizant report and a company looking to hire their 'fact-checkers-on-steroids' call them. A virtual identity defender's role

With companies pushing voice assistant services everywhere, the UX has never been more important

is to create authenticatable digital watermarks that prove the genuineness of someone or something on the internet. The lack of these can also indicate a foul play. Fact-checkers are already being employed at Facebook and they are being trained to work with machine learning algorithms that can verify the authenticity of potential deep fakes.

VOICE UX DESIGNER

Siri, Google Assistant, Alexa, Cortana, Bixby... there seems to be a dedicated voice assistant from every major tech company. They're in our phones, PCs, fridges, washing machines, toothbrushes... need we say more? Voice is the new frontier of computing for the 2020s (Cognizant, 2018). However, these voice 'assistants' are not as anthropomorphised as we'd want them to be. They lack colour and creativity in their conversations with humans. Since there are 7 billion people in the world with different cultures, dialects,

Deepfakes are impossibly accurate in some cases
