

VISUALISING THE PERFECT SMARTPHONE FOR INDIAN NEEDS

(Digit Edition)

Performance

Our ideal phone would feature the upcoming Qualcomm Snapdragon 865 5G SoC, the upcoming Adreno GPU (650?), 6-8GB of RAM and 128GB internal storage. An expandable storage slot is an added bonus. Integrated into the phone would be a stellar gaming mode that would sport features like auto-rejection of calls, full-screen mode, recording button, and more. An in-built liquid or air cooling system could be too much to ask for the price we desire, but hey, imaginary phone, so why not?

Phone unlocking

Face Unlock is unnecessary. Apple's Face Unlock is exceedingly accurate, even in poorly-lit conditions, however, having to pick up the phone every time, is unnecessary. Especially since we now have technologies like in-display fingerprint sensors which are a Godsend. We prefer optical under-display fingerprint sensors in comparison to ultrasonic ones since they are much faster. The fingerprint sensor on the Google Pixel 3a and 3a XL resides on the power button and feels like a great, viable option as well.

Additional features

Firstly, in several rainy cities in India, water-resistance is an astoundingly convenient feature to have. Bluetooth 5.0 is a welcome feature too, since it gives you the ability to play audio or media on two devices concurrently. A dual-SIM smartphone is integral in Indian markets since most users carry around two SIM cards after JIO came into existence. The device should also have certain future-proofing features such as a USB-Type C charging and 5G readiness.

As mentioned above, an expandable SD card slot is infinitely useful since smartphone storage capacities can go up to ridiculous levels with this added feature. This is convenient for users who use their smartphones as their only device and content creators. Certain Pixel phone renders have pointed out that the smartphone could sport Soli radar components to enable touchless gestures. These gestures may be gimmicky, but if anyone can make them actually efficient, it's Google. So, these touchless gestures would be a good addition as well. The squeeze feature in phones such as the HTC U12 Plus and Pixel 3 lineup is also extremely handy, but this squeeze must be reassignable to any app or action.

Design

An AMOLED full HD (the difference between FHD and QHD isn't all that discernable to the naked eye) screen with 120Hz refresh rate and 1ms response time for India's ever-escalating gaming needs. We would prefer a curved screen with an aluminium frame and a glass back panel (for wireless charging) with gradient colouration like the Huawei P30 Pro. The Redmi K20 Pro is a testament to the fact that mid-range phones can also sport premium-looking glass bodies. The smartphone must also house two front-firing speakers to avoid situations where the secondary speaker, usually at the bottom of the phone, gets covered by users' fingers, especially during gaming.
