

Long term HIV protection

Merck have come up with an implant that delivers a year's worth of HIV-preventing medication gradually. <https://digit.in/aug19-41>

Climate is warming faster

The climate is warming faster than it has in the last 2,000 years, we could soon see a "Little Ice Age". <https://digit.in/aug19-42>

All things

They're messy but heaps of fun

Dhriti Datta | dhriti@digit.in

Slime is a big craze. And if you say their appeal has passed, have a look at the views these gooey messes garner on YouTube even now. A tub of ooze which is malleable, kind of Non-Newtonian and just plain fun never really gets old. Being the curious geeks we are, we embarked upon a journey to make three different kinds of slime with very different properties and consistencies. Let's have a look at Fluffy slime, Oobleck slime and Magnetic slime.

FLUFFY SLIME

Ingredients - Fevicol (PVA glue), Water, Shaving foam, Food Colouring (optional), Baking soda, Contact Lens solution, Thermocol, also known as Polystyrene (optional)

Procedure

First, take some fevicol in a bowl depending on how much slime you want to

make. We took around 250ml or 1 cup of fevicol. Add three teaspoons of water and some food colouring (optional) to the fevicol. Mix the solution well. Add shaving foam to the solution and proceed to mix it well again.

Next, take about a teaspoon of baking soda and mix it into the solution. Then, add around a tablespoon of lens solution and mix well yet again. You should feel the solution thickening up and forming a guggy texture. If the solution isn't thickening up, add some more lens solution, but a little at a time, since you don't want your slime to get really firm.

Once, the solution has thickened up sufficiently that you feel confident kneading it, scoop it out in your hands and begin to work the slime by pulling it and folding it in itself. Apply some lens solution to your hand if the slime is very sticky. Once you have worked it enough, you will have your very own fluffy slime!

Note: If you add thermocol to your slime while it is still in the bowl and then begin working it, you will get fluffy, crunchy slime with great texture as seen in the image above.

OOBLECK SLIME

Ingredients - Water, Cornstarch or Corn-flour, Food colouring

Procedure

This is a very simple slime to make, however, it is not as handy (playable) as other slimes, but it has a very strange and interesting nature. First, take two
