

Hope Probe launches in 2020

The UAE Space Agency will launch their Mars mission spacecraft, the Hope Probe in less than a year. <https://digit.in/aug19-23>

Black carbon detecting sensors

A research team has created a new affordable sensor network which detects black carbon. <https://digit.in/aug19-24>

Nebulas are giant clouds of diffuse dust and gas in space. While some nebulas are the remnants of stars gone nova, others are stellar nurseries where new generations of stars are born.

The cat's eye nebula is surrounded by rings or shells, which are the ejecta of a dead star

The Orion nebula is one of the brightest known, and is easy to spot with the naked eye, located just below the three stars forming Orion's belt. The ancient Mayans considered it to be the cosmic fire of creation, which is true enough considering it spawns new stars.

This false colour image of the crab nebula combines data from five astronomical instruments - Chandra (purple), VLA (red), Spitzer (yellow), Hubble (green), and XMM-Newton (blue). It was first observed in 1054 AD and is now one of the most popular objects in the sky.

This is one of the sharpest images of the helix nebula ever captured

The ring nebula shows a star in its death throes, and is a well studied example of a planetary nebula

This image captures the complex structures within the Twin Jet Nebula

The Horsehead Nebula is also in the constellation of Orion, and is a stellar nursery
