

RC Haptic Vest for dogs

Scientists in Israel have developed a remote controlled haptic feedback vest for dogs. The vest lets humans control their dogs remotely via vibrations. Researchers have assured that the vest is completely harmless to the dogs and is pretty much a modified dog vest with wireless circuitry. The vibration motors are very mild as well.

Dogs are usually trained through the positive reinforcement method. This is where you use a clicking sound when the dog obeys your command and reward it with a treat. The idea with the feedback vest is along similar lines, only instead of the clicking

sound, you're using the vest's vibrations. The added advantage of the vest is that it'll work even if the dog can't hear or see you. Researchers used the vest on two six-year-old dogs. They said it was very easy to transition to using the vests for already-trained dogs but they've yet to research training a dog from scratch.

Apart from blind and deaf dogs, the vest is useful for blind, deaf or mute owners and service and rescue dogs. You no longer have to worry about loud noises and other distractions preventing you from being able to issue orders to your doggo.

IBM Foldable Smartwatch

IBM have apparently invented a foldable smartwatch, which when unfolded can go from a watch to a tablet. Basically a full-sized tablet, yes.

The patent is titled 'Variable display size for an electronic display device'. Initially, you've got a what looks like a smartwatch with a regular sized, bezel-less display on it. But then under the watch you have seven additional stored display panels. The patent doesn't explain how the unfolding or assembly of the device works, but according to IBM, users will be able to extend the area of display from one to two, two to four, and four to eight panels. Ah, we guess that's where the 'variable' comes from.

Each panel is 3 x 2 inches. At eight panels you get 12 x 8 inches. Plus you can keep altering the size as you see fit so, whatever works for you, we guess. Although, it's just a patent, we're probably not going to see this anytime soon. It's definitely very cool though. Seeing as we have no idea how they're going to pull it off, we'll only have to be patient about this one.

Hasbro Boba Fett helmet

At the San Diego Comic-Con this year, Hasbro revealed their newest entry in the premium Black Series line of costume accessories, Boba Fett's helmet.

The Black Series line consists of a array of Hasbro's top-end toys, from highly detailed action figures, to incredibly accurate props such as lightsabers and other wearables.

Over the last few years they've released a series of Star Wars related helmets, with the likes of Kylo Ren, Stormtroopers, Shadow Troopers and

X-Wing pilot helmets already in existence. The latest entry to that line is Boba Fett and it's expected to come out sometime in 2020, we're guessing sometime before Halloween (not that we celebrate that here).

The helmet has been made with great accuracy; the paint, dents and scratches have all been made to match the helmet, scratch for scratch, from 'The Empire Strikes Back'. Preorders for the helmet have already begun, though we're not sure if they ship here to India. The helmet will set you back by \$119 USD.
