

Greg Moran
Co-Founder & CEO -
Zoomcar

The Internet of Moving Things

The latest company to inch towards Unicorn status has more to offer than just a rental service

Aditya Madanapalle |

Q Can you tell us about how technology is allowing for new ownership models for vehicles, and what Zoomcar is doing in that space?

Moran: Owing to technology and the ever-expanding digital infrastructure, we are looking at trailblazing models of

ownership, having a strong component of shareability. The shared model of ownership is perfectly suited for a market like India that is densely populated and well connected through affordable smartphones and mobile internet.

At Zoomcar, we have been at the forefront of the revolution, ushering India into easily accessible shared mobility models. Our subscription model will make it easier for users to

subscribe to a car, simply through their mobile phones.

Furthermore, all the cars at Zoomcar and ZAP Subscribe are fitted with Cadabra that tracks important data about the car in real-time. It leverages the Internet of Moving Things to track the distance travelled, fuel used, clutch performance, etc. and helps car owners or drivers keep tabs on important performance metrics like clutch position, harsh braking, inconsistent acceleration, seat belt usage, and engine health, among others. Equipped with Bluetooth and 4G connectivity, Cadabra receives OTA updates and also connects with emergency services in case of any on-road accidents.

Q How is Zoomcar different from the competition? Are there any difficulties or local problems that Zoomcar is trying to tackle?

Moran: Zoomcar has been India's first and largest self-drive rental company. We have ushered India into a self-driven model of shared mobility that users can rent by the hours or days, without relying on chauffeurs. Furthermore, with the launch ZAP Subscribe, we have successfully introduced and established subscriptions as a model for car ownership. ZAP Subscribe helps every Indian household fulfil its dream of owning a car without the hassle of down payments, service or maintenance charges. The platform is presently 2X larger than India's largest car dealership platform and we intend to keep leveraging ZAP for providing convenient mobility solutions to Indians.

Q What are the benefits of an ecosystem of connected vehicles? What are some of the ways that connectivity improves mobility?

Moran: Having an ecosystem of connected vehicles enables a state to easily adopt shared mobility solutions. Given the lack of infrastructure and increasing levels of pollution and traffic jams, India cannot afford to miss out on shared mobility solutions. A car shared, in my opinion, takes 20 other cars off the road. It discourages personal ownership of cars and helps the government and the users to optimise the currently available resources and infrastructure. **1**
