

SECURITY WATCH

Vulnerabilities detected on Google Nest Cam IQ Indoor Camera

The Cisco Talos research team discovered a number of major vulnerabilities in the Nest Cam IQ. The flaws are in the Weave protocol, used for setup and communications. The weave-tool binary also resides on the camera and makes it vulnerable as well. There were found to be a total of eight vulnerabilities which include denial-of-service issues, code execution and information leaks. The flaws include an exploitable denial-of-service vulnerability and a vulnerability that allows potential attackers to gain sensitive information from the device. Other flaws can cause issues such as integer overflow, luring users into opening a malicious Weave or a Weave command, and possible arbitrary code execution by hackers.

MOBILE WATCH

LG K50S

LG recently announced two spanking new smartphones - the K50S and K40S. These phones are notable for the MIL-STD-810G toughness rating, which makes them inordinately tolerant to harsh treatment. The LG K50S sports a triple rear camera setup mounted horizontally. The display is a 6.5inch HD+ screen with minimal bezels around the edge. However, some may be happy with this as in-display fingerprint sensors can be a hassle to some. The phone is powered by Android 9.0 Pie with 32GB internal memory and 3GB RAM, however, LG hasn't revealed the processor that resides within it. Other features include a sizeable 4,000 mAh battery, DTS:X 3D sound, and a micro SD card slot. The device is expected to cost around ₹18,999.

APP WATCH

Checketry

Checketry is a neat little download manager that gives users the ability to sync download progress between their PC and smartphone. If you're not blessed with super high-speed internet, or if you are, and the connection is down for some odd reason, downloading large files can be a tediously slow process. Sometimes files as small as a single GB can take hours to download, and the issue just gets bigger with the file size. Waiting around for the file to download can be annoying in such instances. If you

don't want to linger around your PC when a file is downloading but you also want to keep an eye on the progress and maybe control it, you will need a capable download manager. Checketry is one of the few efficient solutions for

this issue which allows user to track as well as manage download for torrent clients, game clients such as Steam, browsers and more on your Windows PC through your smartphone (An-

droid or iOS). It is capable of downloading pretty much anything since it supports an array of formats.

The app brings together all download information from your desktop including download speed, time remaining, size, progress bar and more onto your smartphone. Additionally, downloads can also be started from your smartphone itself and actions such as pausing, resuming or cancelling downloads can all be accomplished on the mobile app. Also, if you shell out some cash for the monthly or annual Premium Plan, you will also be able to modify settings such as desktop sleep and shutdown timer. In addition to all of the functionalities, the app also looks aesthetically-pleasing and is completely ad-free!

Google Gallery Go

Gallery Go by Google Photos is a lightweight, fast photo and video gallery with features such as automatic folder organisation, a plethora of editing tools, and offline-mode.

Mubert

Mubert is the first ever generative music streaming app that uses patented AI technology and a user-generated sample database to create experimental electronic music.

Kwench

Kwench reminds you to stay hydrated at regular intervals, intelligently by utilising user-fed information such as body composition, age, climate and other such factors.
