MSI GP75 Leopard 9SE Gaming Laptop

Looks that dazzle

The MSI GP75 Leopard 9SE sits somewhere in the middle of the MSI laptops SKU stack. In the GP-series, this particular configuration is the only one that sells in India. If you want a better GPU, you will have to look towards the GE, GS or GT series. And if you want to save a little money, then the GL series is where you can get a 1660Ti or a similar 2060 configuration for about 20K less. The difference would be with the reduced SSD storage space and a 120Hz refresh rate screen as opposed to the 144 Hz screen on the GP75.

PERFORMANCE.....	85
FEATURES.....	81
BUILD.....	78

include a webcam module at the top. On the I/O front, we have a card reader, 2x USB 3.1 ports on the right side. Then on the left we have the Ethernet, HDMI, mini-DP, USB 3.1, USB Type-C and the audio jacks.

The intake vents sit right on top of the fans so you have lesser obstruction but there will be more dust accumulation over time. The exhausts point sideways and backwards. On the inside, we see that MSI has improved on the cooling assembly. There are four heatpipes running over the GPU and three heatpipes running over the CPU, one of which snakes onto the GPU as well. Given the RTX GPUs are a lot more power hungry and generate an ample amount of heat, this seems just about appropriate. Most of the heat generated is centered around the keyboard, with the palm areas being cool even during heated gaming sessions.

There's also a provision to slip in an additional M.2 SSD should you want to. Overall, we have a pretty good looking and well-thought hardware layout in the MSI GP75 Leopard 9SE.

Performance

We started off with the synthetics for the MSI GP75 Leopard 9SE. Time Spy scored 6151 points which is pretty much the usual for the combination of

an Intel Core i7-9750H along with an RTX 2060. In the other benchmarks, we scored: Fire Strike - 14450, Fire Strike Ultra - 3599, Port Royal - 3268 and in Cloud Gate - 36560.

Coming to the gaming benchmarks, we managed to get 59 FPS in Assassin's Creed Odyssey, 72 FPS in Shadow of the Tomb Raider, about 145 FPS in PUBG, and 61 FPS in Deus Ex Mankind Divided. All of these games were run

on Ultra settings at 1080p resolution. Overall, the frame rates are very comparable to other units we've tested with this particular configuration. The GS75 Stealth 9SG comes with a 144 Hz panel so that's always a treat when you're gaming.

Verdict

The MSI GP75 Leopard 9SE is visually different from the other MSI laptops we've seen so far. It's metallic sheen certainly sets it apart in MSI's own lineup. For Rs.1,69,990/- this configuration is quite a good one and we really don't have any complaints aside from the NVMe SSD that you get. For this price, we'd really like to see the benefits of NVMe stand out and that might require an aftermarket upgrade. The only downside is that it will certainly void your warranty. The GP75 promises to give you a sleek looking unit with performance that sits right within the sweet spot and it certainly delivers on that front.

Build Quality

The MSI GP75 Leopard 9SE looks very similar to the GL series from the outside. The thickness, the vents, the top surface, etc. look quite the same but when you open the unit, you are greeted with a metallic panel around the keyboard and white etching goes really well with the look. The power buttons as well as the cooler boost and Steelseries buttons meld into the top surface without disturbing the design. The keyboard isn't that different from the previous ones we've seen on MSI laptops but with the metallic surface reflecting more of the RGB lighting, the keyboard just pops out more. Thankfully, you can tone it down in the Steelseries software should it become a bit too much for your taste.

One of the key differences you'll notice when moving up from the GL to the GP series is the reduction in the bezel size. It's about 5.7mm thick and on a 17.3-inch panel, it looks even smaller given the screen-to-body ratio of a little over 80%. Despite this reduction, MSI has still managed to
