

MAKE MEMES

The ability to write compelling text, use appropriate typography and combine them with effective images is a skill that can be learned for both pleasure and profit. Experienced copywriters in the advertising industry can get paid more than ₹4,000 per hour. You can make advertisements, fliers, posters, memes, or a seductive party invite. The basic principles are timeless, succinct and precise text, leave some room for the imagination, and have an element of surprise. Use a rousing headline, powerful typography and exciting graphics. Have a call to action, and invoke a sense of urgency. Keep it fresh, relevant and timely. As original content is mana on the internet, if nothing else you are sure to get some likes and upvotes.

decide on a route. If you are going on a drive, ride or hike, it is always a good idea to keep a physical map handy in case there are any problems with the electronics. It is also a good idea to mark out the route you will be taking, especially for trips lasting several days.

There are many types of maps available, including topographical maps, tourist maps and road maps. These maps are available in tourist centres, railway stations and on the internet as well. If you are someone who goes on frequent trips, it is a good idea to get a road atlas. This prevents you from having to deal with large and unwieldy sheets, which are typical for road maps. Tourist maps will have points of interest that can be checked out around a particular area, which is quite handy. Every map has a few common elements. These include the scale, which tells you how much distance on the map corresponds to the distance in the real world and an orientation which informs you which way is north. As a matter of convention, the top of the map indicates north.

Now, it is handy to have a compass, and there are some really small ones available. It is a good idea to get a dashboard compass for a car. For other purposes, there are compasses incorporated in keychains, pendants, carabiners and watches. Take your pick. In case you do not have a compass, you can

find north using a wristwatch and the Sun. In the northern hemisphere, point the hour hand towards the Sun. Now visualise an imaginary hand pointing towards 12. Bisect the angle between the hour hand at this imaginary hand. That line points to the south pole. If there is no watch available, then it is possible to use a long stick stuck into the ground. Mark the top of the shadow with a cross or a pebble. Now wait for about fifteen to twenty minutes, and mark the tip of

LEARN TO TIE A KNOT

Learning to tie knots can be useful for a number of outdoor pursuits, including climbing, fishing, camping, boating and can come in use for a surprising number of everyday situations.

the stick's shadow again. Draw a straight line between the two marks, and you get a west to east line. In the night, it is possible to do this by finding the polestar. It is a good idea to learn the names of the important stars and constellations as well, as they can help with orienting yourself during the night, which is often quicker than even using a compass. The Great Bear and Orion are the two of the most important ones. The Great Bear can be used to find the north star. The three stars in Orion's belt rise in the east and set in the west.

TELLING THE TIME

Being able to tell time without a watch handy can be an imprecise activity, but it is still possible to get a rough estimate for practical purposes, such as finding the amount of time left till sunset. The simplest way to estimate the time is to look at your own shadow. This will require some observation and practice, but everyone acts as a walking sundial. When the Sun is directly overhead, it is noon, and the shadows grow longer towards sunset. A more precise approach is to measure the distance of the Sun from the horizon using palm widths. First, find a clear line of sight to the horizon. Then, align your hand along the horizon, and start stacking up the hands one above the other till you reach the Sun. Every palm width is approximately an hour. If you stack your hands three times, and then two fingers, then there are roughly three and a half hours till sunset. Remember to not look directly at the Sun while doing this. During the night time, there are two ways to tell the time. The first is to use the constellation of the Great Bear as a celestial clock. It rotates in a counterclockwise direction around the polestar, every twenty four hours. If the Great Bear is directly above the pole star, then it is 12:00 AM, and if it is to the left of the polestar, then it is 3:00 AM. The path of the Moon across the sky can be tracked to tell the time. It takes approximately 6 hours for the Moon to reach the highest point in the sky after sunset. By dividing the sky into four quarters, a rough estimate of the time remaining till sunrise can be made. For better estimates, it is a good idea to always be aware of the timings of the sunset and sunrise. ❏
