Reon Pocket

The Reon Pocket is a wearable AC unit created by Sony. Yes, you read that right, it's a wearable air conditioner. The Reon sports a small form factor that you can easily hide within your clothes. The device can lower the temperature around you by about 13 degrees. That's pretty unbelievable, especially for something that is roughly around the size of a smartphone.

The Reon has been designed to sit snugly in between your shoulder blades, right under the nape of your neck. Unfortunately, you'll need a custom T-shirt from Sony with a small pocket in that area, or you know, just sew on some make shift pockets

or holds. We know we would if it meant being able to beat the heat, especially in a city like Mumbai.

Once you've got the device on yourself all reared up to go, the device is able to both generate and absorb heat, depending on your personal needs. It does so using something called the Peltier effect – an effect that occurs when you run a current between two conductors. This results in the device absorbing or generating heat where it comes in contact with your skin. Like we mentioned above, it can not only lower your temp by 13 degrees Celsius, but it can also increase it by around 8.3 degrees Celsius, if you deem it necessary.

Samsung Galaxy Fold concepts

If you've been keeping an eye on this section in the past few months, you'd have noticed some interesting fold design patents that have been coming up. Samsung seems to be churning out foldable phone designs, which were unearthed by Dutch tech patent archaeologists at Let's Go Digital.

One of those foldable phone designs is the Galaxy Z-Fold, which is able to fold and open in a Z shape, allowing it to take the form of both the standard-sized smartphone and expand into a large tablet display. It's a triple fold display, so when it's folded up in its smartphone form, it appears pretty thick.

Among the patents are more designs and concepts for foldable phones, including a foldable with detachable screens, a foldable phone with a foldable display that wraps around the phone's body and moving past foldable, you have the rollable Galaxy, where you can expand the screen by rolling the screen out upwards or sideways even. There's just no end to them. You can check the designs out here: <https://dgit.in/samfold>

Xiaomi Moestar Spaceship Smart Pet Nest

The Xiaomi Moestar Spaceship Smart Pet Nest is a cute little pod that is designed for your pets, in case the name didn't give it away. Like the name suggests, this isn't an ordinary pet pod, but it's a smart pod which comes equipped with a lot of cool features in addition to its cool design. Its design mimics the model of the SpaceX Dragon 2 spacecraft.

The pod has a capacity of 33-liters, which means it can accommodate cats up to 8kg in weight, or dogs that are up to 4kg. The reason for the disparity in weight is the size of the pod's entrances,

which only have a diameter of about 19cm. Cats should have no problem squeezing through but dogs will struggle, especially as they start growing.

The Moestar has its own LED illumination, and you can control the colour of the light using an app via WiFi. But that's not all you can adjust, the Moestar app also allows you to control the temperature within the pod. Sensors at the bottom of the pod can monitor your pet's movement and sleep cycles. The pod can also apparently detect if your pet accidentally poops, making it great for potty training young pups as well.
