

OnePlus 7T is here!

The OnePlus 7T has been officially announced with 90Hz refresh rate and a triple camera module. <https://dgit.in/oct19-39>

Back to the yesteryears...

The 2020 iPhone is rumoured to be going back to iPhone 4-esque metal frames. <https://dgit.in/oct19-40>

access data storage, so there's the added flexibility. A lot of Firebase's functions are similar to Parse which was also a very popular BaaS. Setting up services that require authentication or access to a database in real time is a breeze. Then there's the analytics part which is quite flexible on its own and allows you to monitor a lot of user metrics.

Like all BaaS, Firebase starts off with a free tier that allows 100 simultaneous connections, 10 GB of data

Firestore

transfer per month, 5 GB of asset storage, 1 GB of realtime database storage and 125K requests/month. Firestore's pricing structure is transparent and upfront with email alerts if you're about to hit your free usage caps. This way, you're never going to be in for a shock. If this seems to be not enough, then there's the Flame plan which starts at \$25/month and increases your limits by a factor of 5-10 on most met-

rics. Asset storage space goes to 50 GB, realtime database storage to 2.5GB and you get 2 million requests/month.

- **Integrations:** Google Ads, AdMob, Google Marketing Platform, Play Store, Data Studio, BigQuery, Slack, Jira, PagerDuty
- **Ecosystems supported:** Android, iOS and Web
- **Used by:** Shazam, New York Times, Duolingo, Lyft, Venmo, Trivago, Alibaba, Wattpad

2. CLOUDKIT

Cloudkit is Apple's BaaS which is primarily focused on the Apple Ecosystem, as is the case with practically everything that Apple makes. Cloudkit makes use of Apple's identity authentication and has a very seamless integration with all Apple services. It's the service that you'd want to go with if iOS is the only ecosystem you're going to be concerned with. It requires the users to be signed in with iCloud and then you can allow persistent data storage for the user and even allow them to share content between users. In a way, by forcing users to sign into the iCloud service, Apple does make this secure but you lose some flexibility for defining your own rules.

Cloudkit's pricing is also a bit different in the sense that it "advertises" itself as a free service because all the data pertaining to the user comes from the individual user's iCloud limit.

It's just that as your app scales, the data transfer limits, request limits, database storage and asset storage will start to vary. The more users you have, the less space each user is allotted for free. Exceeding the free limits will cost \$0.03/GB for Asset Storage, \$3/GB for Database storage, \$0.10/GB for Data Transfer and \$100 per 10 requests

(over the req/sec limit). If your app has a million active users, then you're allotted 100 requests per second. That translates to 10 requests per 100k users which is quite low at that scale, so your overage costs are going to rack up quite fast. So, no matter which tier you're on, you're always going to exceed the requests/sec metric and pay through your nose. No such thing as a free lunch.

- **Integrations:** iCloud Drive, iCloud Photo Library, Authentication, private and public database
- **Ecosystems supported:** iOS, Android (non-native, via Cloudkit JS)
