

Google Play removes 29 apps

29 malicious apps with 10 million collective downloads have been removed from Google Play. <https://dgit.in/oct19-41>

Google Bulletin shutting down

Google's hyperlocal news service, Bulletin is shutting down in November, less than 2 years after launch. <https://dgit.in/oct19-42>

- **Used by:** iOS Native apps such as Apple Photos, iCloud Drive, Notes, News, Safari

3. PROGRESS KINVEY

Kinvey is one of the early companies to enter the BaaS segment and also boasts one of the broadest bouquet of services. It offers everything that you can possibly think of which count towards the bare essentials of building an app and on top of that you have access to a lot of code libraries to integrate third-party services. This makes it quite user-friendly.

Kinvey offers a free trial for startups with fewer than 25 employees and individuals. However, if you don't meet either of these conditions, then Kinvey costs a lot. They aren't transparent

about the costs and estimates quoted by individuals can range up to USD 24,000 per app per year. For that it gives you about 50 GB of 1 TB, up to 10,000 B2C users or 1000 B2E users and supports 3 environments per application. So Kinvey does provide a lot of storage space and auto-scaling infrastructure backend but the cost is one of the highest in the market.

- **Ecosystems supported:** iOS, Android, Web, Xamarin

4. BACKENDLESS

Another early BaaS company that has a wide assortment of integrations and has plenty of flexible payment plans to work with. Backendless has a free tier that allows 1 Million API calls/month, lets you push 50,000 notifications and store 5 database tables. After which you can switch to a starter plan that costs \$15/month that gives you 5 Million API calls/month, 20 tables

and 100,000 push notifications. Then there's a \$25 plan, \$99 plan and so on.

- **Ecosystems supported:** iOS, Android, Web

- **Used by:** Digital Copel, YTCOUNT, Lifebook, BTC Market Ticker, Game with Me, Tacoma Japantown Walking tour

5. AWS AMPLIFY

This is Amazon's BaaS that's tied in with a lot of the other AWS services. So if you're already on AWS for your hosting needs, then AWS Amplify becomes a rather simple choice. It provides seamless integration with iOS, Android, React Native and HTML5 and has functions such as notifications, ability to provide API endpoints, notifications, analytics, etc. which are helpful in building an app.

AWS pricing is on the basis of two metrics – hosting and build & deploy. It has a free tier that provides 1000 build minutes per month and for host-

ing you get 5GB of storage per month along with 15 GB of data transfer. Exceeding this limit leads to the pay-as-you-go model which is characteristic of AWS pricing.

- **Ecosystems supported:** iOS, Android, Web, React Native
- **Used by:** Netflix, Tinder, Yelp, Airbnb, Periscope, Etsy, Easy Taxi, Hike
