

POWERUP 4.0

Funding: US\$ 470,587 pledged of US\$ 40,000 goal
Link: <https://dgit.in/powerup4>

POWERUP 4.0 is the company's fourth rendition of their smartphone-controlled paper aeroplane which features an onboard flight computer, autopilot assist, two new sensors - gyro and accelerometer and a sturdier design. The steps are laughably simple - make a paper plane, attach the POWERUP 4.0 module to the plane and control it with your smartphone. The company claims that even a piece of paper, which is unfolded and flat, can also be flown with their module. They've even flown a piece of lettuce with it! The device comes equipped with a wind stabiliser, can go against a strong current of wind and comes with landing and launch assist. To add to this impressive set of features, POWERUP also houses an auto-stabiliser. Paper planes powered by this unique piece of tech can even perform aerobatic stunts such as loops and barrel rolls through the app.

The POWERUP 4.0 also houses two motors which give your plane a hefty amount of thrust and the ability to make sharper turns. With flight assist, the company claims that you can fly just about any material such as wood, cardboard, styrofoam and of course, paper. After each flight, users will be able to access certain statistics and information about the quality of their flight and even get customised tips to improve their next flight. Additionally, you have LED lights on the underside of the plane to make it easier to see your flight soaring, even at night. The battery allows you to fly your paper plane around for 10 minutes and the module has a wireless range of up to 230 feet. The plane can fly up to speeds of about 32 km/h.

DELTA

Funding: US\$ 1,760,008 pledged of US\$ 50,000 goal
Link: <https://dgit.in/delta>

The Delta is a lightweight and compact battery-powered generator. Gasoline generators are typically expensive to maintain and emit carbon monoxide, which is non-existent in battery-powered generators. Delta is capable of recharging itself from 0 to 80 per cent in just 60 minutes, has a lifetime battery warranty, and requires no gas. It has the ability to power 13 devices simultaneously and houses four regular USB ports, two 60-watt USB-C ports as well as four wall outlets. The device also comes with an LCD display screen that has all important information such as battery level indicator, remaining

charge time, overload warning and more. The device has a total output of a massive 1800W and 140 lithium-ion battery cells and it can pretty much power anything, right from your mobile phones to your electric vehicle! The unit can store up to 1295Wh of energy and their X-Stream Recharge Technology allegedly provides the fastest recharge rate on the market. So, the Delta can be fully recharged in under two hours just by utilising any regular wall outlet, or solar panels. The generator is pretty compact as well and can be a portable source of power for all your needs.

Chasing Dory Underwater Drone

Funding: US\$ 42,989 pledged of US\$ 30,000 goal
Link: <https://dgit.in/chasingdory>

Chasing has created Dory, an underwater drone that is both portable, due to its small form factor (7.4 inches wide) and relatively affordable. According to the company, Chasing Dory is the smallest underwater drone ever. The company has also created an accompanying app that lets you use your smartphone as the controller. The app features joy-stick controls which allows you to make your way through the ocean in an extremely user-friendly manner. Additionally, you can

post the footage Dory records or even live-stream straight from your smartphone. The device houses an array of sensors such as temperature and depth sensors, gyroscopes, accelerometers and more. There's an f/1.6 camera with a 100-degree field of view

along with two 250-lumen lights that can bring out great footage even in low-lighting situations. The drone also features Depth Lock which allows users to input a precise depth that the drone will stay locked on. There's also a 45-degree tilt lock that allows you to scan the ocean floor or water surface at natural human-head tilting positions. The device can dive down into the ocean up to 49-feet and can reach speeds up to 1.5 knots. Additionally, there's also a Wi-Fi buoy included which can store up to 8GB of footage. The drone has a battery life of an hour, while it takes the device two hours to charge completely.
