

GAMING

LOOKING TO UP YOUR GAME THIS DIWALI?
WE GOT YOUR BACK.

Manish Rajesh | manish@digit.in

You've finally finished building that fancy gaming PC, jazzed it up with all the RGB and the liquid cooling, all you need now are the peripherals, and it's important to pick the right ones. These will be your gaming companions for a long time, after all.

Gaming is a pretty broad category, and one that's constantly growing. The gaming peripherals market does have its shifts, from weird shapes, to RGB everything, and even to plain and simple. We're going to help you decide the right peripheral for you in each of these categories, and even suggests our favourites in each category. Let's begin with keyboards.

GAMING KEYBOARDS

There are plenty of options when it comes to gaming keyboards. Keyboards are one of those devices that rely pretty heavily on personal preference. Because of that, it's pretty hard to recommend a keyboard that will satisfy everyone.

The way to go for your gaming keyboard is mechanical. Sure, if you prefer membrane, or even hybrid keyboards, we won't stop you. Like we said, it's based on preference. But we do believe that the best gaming experience is to be had on a mechanical keyboard.

When it comes to mechanical keyboards, there are a few things you need to consider. Comfort is the name of the game for just about anything you purchase. So first and foremost,

you need to be comfortable with the keyboard you pick, and since it's mechanical, you need to be comfortable with the choice of switch as well. There are a LOT of switch options on the market, but you can't go wrong with Cherry MX keys, which are known to be reliable and have decent life cycles as well.

Next, is the keyboard itself. Some might prefer feature-heavy keyboards, like the G.SKILLS Ripjaws KM780 for example, which is a very feature-rich keyboard. We're talking stuff like six extra programmable keys, USB and audio passthrough, a separate media

all common in most mechanical "gaming" keyboards today. We believe that RGB really isn't that important and isn't worth prioritising when looking for a keyboard. Simple backlighting is still okay.

MOUSE

Casual gaming is possible with any mouse really. But you're here for a gaming mouse, picking the right one is once again, all about the comfort. You're going to spending hours on end holding this mouse, so it might as well be comfortable. An uncomfortable mouse could even be bad for your

hands and wrists. You could have a mouse with the best sensors in the world, but that doesn't mean that your experience with it will be enjoyable. We're veering into personal preference territory again, but we will throw in a few suggestions as usual.

Corsair K70 RGB Mechanical Keyboard

keys panel etc. However, G.SKILLS' keyboard software could use some work. If you're in the market for a more simple option, you can't go wrong with the Corsair K70. It has simple backlit options in addition to RGB. It also comes with most Cherry MX Switch options. As a plus, Corsair's software is one of the best out there.

Features like full N-key rollover, which is basically anti-ghosting, backlighting, and macro functions are

The first thing to consider is the shape of the mouse. Many people have different mouse grips, or hold the mouse differently. There's a palm grip, the claw grip and the tip grip and usually, the different grips can be more or less comfortable depending on the shape and size of the mouse. For example, the tip grip works best with small mice, such as the Cooler Master MM710, which is a very small and light mouse. Speaking of light, even
