

weight is a factor to consider when looking at comfort. You also have to take into consideration your dominant hand when picking a mouse. A lot of mouse designs are catered to right-handed users. Look for left-handed or ambidextrous designs, if needed.

Like keyboards, there are mice overloaded with features that you can go for, such as the Logitech G502, which has a lot of modification options when it comes to size, weight and can even adjust and adapt to different mouse pad surface textures! Then there's the Corsair Scimitar Pro, a MMO gaming mouse which comes with 12 extra keys on the side for all your MMORPG needs. However, if you're in the market for a simpler mouse without all the frills, you've got options across a wide budget. Cheaper options (₹1-2K), like the Logitech G102 come with the risk that they might not last very long. At a higher price point (₹4-6K) you have Zowie's EC-2 mouse, which is often the choice of professional FPS players. There's also Razer's Deathadder Elite (₹8K), if you're a fan of the green and black colour combo.

On a final note for mice, don't get sucked in by mice with absurdly high DPI. You're almost never going to need to use anything higher than 6000 DPI, forget those with an absurd 16000 DPI.

HEADSETS

We've extensively covered headphones in the headphones section of this cover story, and most of that still applies when you're picking a gaming headset. You will after all, use it for more than gaming. When picking a gaming headset, you have just a few more things to consider.

Logitech G502
Gaming Mouse

Headsets are pretty important when it comes to gaming, as audio plays a very important role in the overall immersion of a game.

Also, when playing competitive games, audio is important in some games, like PUBG or CS:GO, to actually perform optimally. Of course, there's the online communication aspect as well, so you ideally want a good mic on your headset that picks up your voice well, and ideally avoids picking up ambient noises like fans for example.

For a premium headset, the best that comes to mind is the SteelSeries Arctis 7. You can't go wrong with this headset, for a premium price, you're getting a very comfortable, versatile and functional headset, with a great mic to boot. Also, it's wireless. What more do you need?

If you're in the market for a more budget option, you could go for the Logitech G430, which is a reliable headset with Dolby Atmos 7.1 surround sound. If you're looking for an even cheaper, reliable option, the HyperX Cloud Stinger is also pretty good, albeit, without premium features.

GAME CONTROLLERS

Controllers have come a long way since their single-button, single-analog-stick humble beginnings. The universal symbol for gaming now comes packed with a lot more features and is not restricted to just consoles. It's also evolved into various different shapes and sizes over the years, but we can all agree that there's a standard shape and layout that we're all familiar and comfortable with.

We're going to stick to that. Ultimately, it's still personal preference.

The default layout we spoke off usually consists of a D-pad, two analog sticks, two trigger buttons, two back-buttons above those trigger buttons, four buttons on the right side, and a start and select button. For the longest time, we've had two players in the game and you honestly can't go wrong with either of them. The latest Sony Dual Shock Controller or the latest Xbox Controller come with everything you need in a controller. Connectivity, comfort, reliable firmware and more. Additionally, they're compatible with pretty much any gaming system, in addition to their own respective consoles and can even work with mobiles thanks to Bluetooth connectivity. The Xbox Elite Controller is a

Xbox Elite controller

great controller that also has buttons behind it, placed in convenient, easy-to-access locations.

Compatibility is also very important when picking out a controller for your system. Before buying any controller, you will need to ensure that it will work with your system. Next, you have to look at comfort. Using a controller for hours shouldn't cause discomfort or pain, that's a huge no-no. Finally, look at build-quality. There are plenty of cheap options on the market that won't last longer than a few months. Even shorter if you're prone to throwing things around in anger.

Try to avoid game controllers with over-complicated designs, and weird shapes. 9 out of 10 times these are extremely uncomfortable to use. Flashy lights and designs are also not a priority.
