

Red skies in Indonesia

Because of a phenomenon known as Rayleigh scattering, smoke from forest fires turned the skies red in <https://digit.in/oct19-85>

Predict the weather

This course teaches you to look at satellite imagery, and make predictions of what kind of weather to expect <https://digit.in/oct19-86>

PREDICTING THE WEATHER

Using unconventional methods...

Dhriti Datta dhriti@digit.in

M

eteorology has become impressively advanced now owing to the formidable capabilities of

modern-day weather radar and other technological tools. You may have heard of old sayings such as “red sky in the morning, sailors take warning” or “if birds fly low, expect rain and a blow”. However, they are often cast aside as the ramblings of some old man or woman that hold no scientific credibility. Then there are widely-observed phenomenon such as tidal waves killing a monumental number of people, but no wild animals perishing. Gradually, over the years, scientists and researchers have

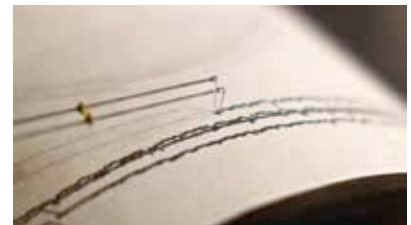

begun looking into these archaic methods and some of these have even been scientifically credited. On the other hand, rapidly advancing technology has also brought us a few ways of predicting Mother Nature’s wrath using technological innovations. Let’s have a look at some of the unconventional methods of predicting the weather.

SSGI (SOLAR SYSTEM GEOMETRY INDEX)

The prediction of seismic activities often proves itself as a herculean task and experts in the field often claim that there is actually no accurate way of predicting tremors with precision. Enter Frank Hoogerbeets and his advanced system he calls the Solar System Geometry Index that can predict possible earthquakes. A self-proclaimed seismic researchers from the Netherlands, the predictions dished out by Hoogerbeets have actually materialised on more than one

(coincidental, as nay-sayers would say) occasion. One of these accurately-predicted earthquakes includes the recent earthquake that jolted California on July 5 and 6, 2019.

Hoogerbeets firmly believes that planetary alignment and lunar geometry in our solar system can efficiently detect seismic activities on Earth. As per his argument, planetary align-

ments tend to trigger electromagnetic force in the solar system which then destabilises tectonic plates. Hoogerbeets also made a prediction that an earthquake of possibly high 6 to 7 magnitude could take place on July 19 or 20. What happened next, you may
