

Samuel L. Jackson as Alexa

GM car owners will be able to download Alexa on to their cars with Samuel L. Jackson's voice. <https://dgit.in/oct19-19>

Another board-game movie

In addition to the Monopoly movie which is in works, another board game named Clue is also getting its own movie. <https://dgit.in/oct19-20>

ECCENTRIC F1 CARS

In the quest for perfect aerodynamics, traction and downforce, engineers have come up with some strange F1 car designs. While only a few of them have proven themselves, regulations have mostly caught up to prevent these designs. Often, the decisions were hazardous to drivers and other races, when they were not outright cheating or finding a way around the regulations.

1971 BRABHAM BT34

Placing large water-cooled radiators for the engines often proved problematic. Brabham engineers came up with another

offending design, with twin radiators mounted on the nose, in front of the wheels. The offending vehicle was nicknamed the "lobster claw" for the unconventional design choice. Only one car was built, and it ultimately failed to prove itself.

1968 BRABHAM BT26

In the late 60s, the "skyscraper" wings of F1 cars were reaching increasing heights in order to provide more

downforce. Brabham went for high wings on both the rear end and the nose, giving it a bi-plane-like appearance, and leading to a very unstable design, especially considering the turbulence of passing cars. The high wings were then banned because of safety concerns.

1972 EIFELLAND 21

The chassis was designed by the eccentric Italian designer, Luigi Colani and based on the March 721 purchased by the

team. There is a lot going on here, but the most offending feature easily is the rear view mirror mounted on a column right in front of the nose of the driver. Apparently the effort was to make everyone else look outdated, but the car did not prove itself.

1971 MARCH 711

Another offending front wing design, the March 711 was known as the "flying tea tray" or the "spitfire". The wing

was attached in an awkward way to the nose of the vehicle, and could be removed if required. At times the team even stripped the car of radiators. Surprisingly, the car and the team proved themselves, but the design was abandoned soon.

1974 TROJAN T103

The large and prominent airbox was tacked on above the engine, as if it was an afterthought. The front wing was

taken off at times, and the rest of the car wasn't exactly a looker either. Only one of the two cars built was actually used in races, and it finished tenth in Belgium and Austria, and fourteenth in Spain. The vehicle retired or did not qualify in the other races.
