

Gender-neutral dolls

Mattel has come out with new gender-neutral dolls that can be a girl, a boy, both or neither. <https://dgit.in/oct19-21>

Some cool racing games

Feel like playing some racing games after reading this article? Check out these 5 racing games. <https://dgit.in/oct19-22>

1976 LIGIER JS5

Another offending airbox design, the 1976 Ligier JS5 pushed the limits when it came to increasing the height

of the air intake system. Even the front wings had some unconventional bulging curves. The vehicle failed to prove itself in the tracks, the team realised its mistake and fixed the ridiculous height of the intake system, but folded after a couple of seasons.

1979 ENSIGN N179

The offending feature featured on the nose of the car, is another attempt at innovative positioning of radiators. The idea

was that by putting the radiators front and center, the sides of the nose would be available for the 'ground effects' airflow. The feature was nicknamed the "cheese grater", and the car failed to qualify seven times, and only managed to finish one race.

1977 TYRRELL P34

Perhaps one of the most recognisable designs on the list, Tyrrell introduced a six-wheeled car to reduce the drag, and increase

the speed of the car in straight stretches. The design proved effective, leading to other teams developing six-wheeled cars as well. In subsequent seasons however, regulations came into place stipulating that cars were to have only four wheels in total.

1995 MCLAREN MP4/10

There are some weird shark nose-inspired aerodynamics here, but also notice the unconventional pair of

wings mounted towards the center of the car. Engineers went overboard with the aerodynamics, and the cockpit was actually way too narrow for the driver, Nigel Mansell to fit. The team had to rebuild the cockpit to allow the driver to get inside.

1978 BRABHAM BT46B FAN CAR

The trickery here is the prominent fan at the back that generated a tremendous amount of down

force by evacuating the air beneath the car. The engineers claimed that the fan was for cooling the engine. The team voluntarily removed the fan variant after a single race, even though the regulators allowed the vehicle to run for the remainder of the season.

2004 WILLIAMS FW26

This team came up with what they thought was a revolutionary aerodynamics package. The offending thing here

is the way the front wings are mounted on the nose. The split approach earned the vehicle the nickname "walrus nose". The design was not very effective in races, and the engineers actually changed the design mid season, after twelve races.
