

SHOWCASE

Electrolux MultiChill Fridge

Among the many home appliances showcased at IFA Berlin this year, one of them was Swedish company, Electrolux's MultiChill four-door fridge, which features a technology called "Frostmatic". What does Frostmatic do? Well, you know how when you buy drinks from the store they're kinda warm and you want to cool them asap? What do you do? Well, you put the drink in the freezer. Only to forget about it and then the next day it's frozen. This needn't be the case with Frostmatic. Simply put your bottles in the middle drawer of the fridge, and

then open the My AEG Kitchen phone app. Yes, there's an app, and it works with both iOS and Android. On the app you can set which drink it is that you're your cooling and what temperature you want the drink at. The fridge will activate quick-freeze and actually notify you, via the app, when your drink is at your desired temperature. Thanks to the app, you can even preset temperatures beforehand, remotely. The fridge can keep different temperatures in different zones at -2 to +7 degrees.

Bosch Silence Edition Appliances

Washing machines, dishwashers, dryers, what do they all have in common in addition to being household appliances? They can all get pretty loud. Bosch aren't fans of the noise, so they've come up with a line of silent appliances. The Series 8 Washing Machine, the Home Professional Heat Pump Dryer, the Series 6 Dishwasher, the Super-Silence Series 6 fridge, and the Series 6 wall-mounted extractor hood, all of which Bosch showed off at Berlin at IFA 2019, fall within the 36 to 59 decibel volume range. That's ridiculously silent, considering the volume level of the sound of breathing is 38 decibels. That's right, one of these appliances is apparently quieter than the sound of breathing.

According to Bosch, even a small change in the decibel rating can make a world of a difference when it comes to how we perceive noise. Just an increase of 10 decibels can be perceived as twice as loud by the human ear.

These models use Bosch's specially-developed EcoSilence engine, which according to Bosch, not only promise keeping the volume down, but can also "dish out" high performance with the best appliances out there.

XPG Headshot gaming mouse

Xtreme Performance Gear or XPG are the gaming division of Adata, and they've come up with a new gaming mouse. What makes the Headshot special is that it's a 3D printed mouse, meaning every single one of them is custom-built for whoever is using it.

Since the mouse is 3D printed, the shape of the mouse can be customised to fit a gamer's hand size, shape, grip preference and more. XPG also takes the recently popular honeycomb structure and puts a twist to it with the "lattice" design. The mouse is printed using PA12, a nylon-based thermoplastic, which is a lightweight material that brings the mouse's weight to around 65 grams.

While there is a mass-production model for Headshot on the way, they have a 4D printed version as well, this is the version

that's custom fitted for each user. XPG will take images of your hands and print / build the mouse exactly to your specifications.

Speaking of specs, it comes with all the high end sensors and switches you'd expect from a gaming mouse, however, don't expect the XPG Headshot to come cheap.
