

Levitating self-solving Rubik's Cube

Japanese inventor, Human Controller, has created a lot of cool but not necessarily useful stuff in the past, including a farting baseball. His latest creation is a levitating Rubik's Cube. Also, it solves itself. He first made the self-solving cube back in April of 2017. It was made using a 3D printer, with custom cores full of servo motors. In the heart of the cube is an Arduino board. The way he's managed to fit everything into the little space inside the cube is quite amazing.

That wasn't enough for Human Controller though, he also went ahead and made a levitating version of the same self-solving cube. He achieves levitation by using powerful magnets, both inside the core and under the table in use.

This actually required Human Controller to go back to the drawing board in order to better manage the space inside the cube's core, which now also had to make room for the powerful magnets. Like we said above, the way it's been managed with the little amount of space available is nothing short of amazing. These magnets interact with the ones under the table's surface, and the opposing forces causes the cube to float. While it solves itself.

You might be wondering, what's the point of having a Rubik's Cube if it solves itself. Isn't that the whole point of it? Well, it's really cool to look at, and sometimes, that's good enough. Hopefully, the Rubik's Cube company actually picks this up – a levitating self-solving Rubik's Cube would be an amazing table piece.

Plyon Plyy

When it comes to controllers there are a few options on the market, but most of them look and offer similar experiences. There is of course, a reason for that, we've come to find this particular design of controllers fairly comfortable, however, it may not be the case for everyone.

Now for people with special needs, there are very few controller options. The Xbox Adaptive Controller for one, helps with quite a bit of customisation options. Now, we can add German-based company Plyon's Plyy controller to this list as well.

Demonstrated at IFA this year, the Plyy is designed for people with limited mobility, or those who have limited use of their hands or fingers. However, that doesn't mean it's not useful for anyone else. The idea is that whoever is using the Plyy can customise it to meet their needs.

The controller isn't just one piece either, it's a whole system of sorts, consisting of two handheld paddles, a mat, analog sticks and various buttons. You simply need to stick the button you want, anywhere on the mat or the paddles. The tech inside the devices can detect touch and pressure, so you can configure your buttons on the fly. The Plyy is currently still in its prototype stages.

Apple Tags

We recently saw the Apple event take place and the Internet is rife with leaks and rumours surrounding the new Apple devices and services. One of the things followers have discovered through some digging, is more information on Apple key finder. Key finder is the tracking system that Apple had promised quite a while ago.

According to screenshots seen on MacRumors, the key finder is being dubbed 'Apple Tags', and they're right around the corner. The Tags work similar to Find My App. You're prompted to tag your belonging, could be anything, a bag or handbag etc. If you need to find the item, the tag starts ringing. It can also warn you if you go too far from the item. No alarms will sound if the item remains inside the user-defined area, or 'Safe Zones'. You can share the location of your object's location with other Apple users as well.
