

Protect sensitive files by encrypting them on WPS Office

edit PDF files itself within the app, which is extremely convenient. There are also other paid features such as extracting all the text from a PDF and copying it, fixing broken files, and more.

ENCRYPTING FILES

Secure your sensitive files on WPS Office by utilising the nifty encryption feature. In this manner, you can ensure that your files can only be accessed by validated personnel by inputting the password you have chosen. It is exceptionally easy to encrypt your files and we commend WPS Office for putting the option in the most intuitive place possible - the 'Save As' window. Go to Menu and then click Save As. Below the blue 'Save' button, you will see an 'Encrypt' option. Click on it and you can set a password to access the document, as well as a separate password to modify it. You can even go into Advanced options and chose different encryption types for some added security. Additionally, the Save As option also brings you yet another feature. You can save your document in multiple different formats, such as the archaic Microsoft Word 97 - 2003 format, in case you're sharing it with

someone still too attached to the good old days...

SKINS AND OTHER CUSTOMISATIONS

If you enjoy customising the look of your apps, WPS Office offers 'Skins' that allows users to do just that. While the options aren't plentiful at this moment, more should be added as time passes. There are dark and light-themed skins, festive skins, coloured-themes and even the 2016 Classic Word format in case you were attached to that format. There's also a Custom tab that lets users construct their own custom skins by choosing a background colour or background image and by changing the font as well as its size. Furthermore, there's an Icon tab next to the Custom tab, which only

Customise the look of the app by using WPS Office's Skins

has the default icons as of right now that are already enabled, but we're rooting for a lot more variety in future updates.

MASS PERSONALISED EMAIL/LETTERS

Mass personalised letters or emails can be a boon, especially for office settings where numerous employees need to be emailed things such as payrolls, transcripts and more. It can even be used to mass print envelopes to different recipients. You can create personalised mass letters easily using WPS Office. Firstly, you must

the required information. However, ensure that the first row or header of each column is something that can be utilised by WPS as a reference variable, such as 'Name' and 'Address' as mentioned above.

Now, you can go ahead and prepare your letter after you have formulated your data source. Next, go to the References menu and then click on Mail Merge. You will see 'Open Data Source' on the top left of the screen, click on it and select the data source spreadsheet you created earlier. Place your cursor on the section of the letter where you want to

You can set the data source as an Excel sheet of contacts to mass create personalised letters

prepare the data you want to utilise on a spreadsheet. It could be as simple as the 'Name' and 'Address' of a set of individuals. Save this spreadsheet in the ET format once you're done adding all

enter your first data point, in this case - Name. Then click 'Insert Merge Field' and select the appropriate reference variable from your spreadsheet file. Repeat the same steps to add as many data points as needed. You can check if you've added the correct data by clicking 'View Merged Data' and then using the navigation options to switch between records.

Finally, you can click on 'Merge to Different New Document' to save each letter separately and in case you're printing mass personalised envelopes or letters, you can just choose 'Merge to Printer' and select 'All' in the pop-up box to print all the numerous personalised letters.
