

OnePlus pokes fun at the Pixel 4

OnePlus took to Twitter to make fun of the Pixel 4's refresh rate bug but then deleted the tweet. Cold feet? <https://dgit.in/nov19-20>

Smishing!

The latest scam, smishing, uses text messages to get you to send money for fake family emergencies. <https://dgit.in/nov19-21>

Teardown: Apple Watch Series 5

Series 5 sports subtle changes barring the 'Always-on' display

Dhriti Datta | dhriti@digit.in

Tighter seal on display

The display on the Apple Watch Series 5 features a pretty firm seal which gives away after a fair amount of prying coupled with some heat and slice action. Screen replacements are feasible since the display does detach via ZIF connectors. The Force Touch gasket connector also sits snugly in a corner behind the display cables.

Inconsistent battery improvements

The battery is glued down to the device which makes it quite a chore to detach. The battery in the Apple Watch Series 5 is labelled A2181 and provides 1.129Wh which is a slight 1.44 per cent improvement over last year's model. However, on the smaller, 40mm Apple Watch Series 5, there's a new battery design which provides a 10 per cent battery capacity boost.

LTPO display facilitates always-on display

The LTPO display on the Series 5 (left) is physically similar to last year's model (right). However, a new display driver and power management IC facilitate the gargantuan 18-hour 'always-on' display feature. It allows the watch to stay awake for longer periods by consuming power in a more efficient manner.
