Google claims that its Project Treble has allowed a historical 22.6% Android devices to adopt Android Pie. <https://dgit.in/nov19-22>

Taptic Engine sports minuscule changes

The Taptic Engine in the Watch Series 5 can be carefully tweezed free from the antenna connector. This reveals that the Taptic Engine featured in the new-gen Apple Watch is extremely similar to its predecessor, however, the connectors have been re-engineered, so the same parts will not be compatible with the new model.

An array of parts and sensors

Once the Apple Watch Series 5 has been dismantled enough, various parts disengage from the main body which are reminiscent of the ones in Series 4. After unscrewing the body, the digital crown, microphone and side button cling to the frame of the watch while the heart rate sensor, ECG components and the charging coil come off with the bottom plate.

The system-in-package – S5

Next up, we have the Apple Watch Series 5's brain, the S5 system-in-package. The S5 features a brand new compass and double the onboard storage (32GB, over last year's 16GB). Most of the integrated circuits are veiled beneath a solid resin layer. The attached display flex cables have gained a few pins over last year's model, so interchangeability is out of the question.
