

Facebook to launch 'news' tab

Facebook is launching a news tab that will provide users access to news from multiple organisations. <https://digit.in/nov19-23>

Twitter removes abusive tweets

Twitter says over 50% of tweets identified as abusive are flagged and taken down before a user reports them. <https://digit.in/nov19-24>

AI ETHICIST

The rush towards ethical AI has given birth to a new generation of AI Ethicists

Dhriti Datta | dhriti@digit.in

A

s AI (Artificial Intelligence) and ML (Machine Learning) solutions take over every facet of our

lives, it is being observed that users' trust in them has been plummeting at a slow but steady rate. According to Gartner, multiple incidents of astounding privacy breaches and data misuse have led to the growing dissonance between AI solutions and their consumers. Regulatory scrutiny for AI is rising across the world, in order to combat such breaches. Despite these efforts, Gartner predicts that 75 per

cent of large organisations dabbling in AI will hire "AI behaviour forensic, privacy and customer trust specialists", in simple words – an AI ethicist, by 2023 to diminish brand and reputation risk. According to a recent KPMG report, the role of an AI ethicist will be one of the most sought-after AI jobs in the coming years.

Bias has historically been a long-standing risk in training AI models, whether it is based on race, gender, age, location, or based on a particular structure of data. Additionally, opaque algorithms such as deep learning can feature various highly variable interactions into their predictions which can be extremely tricky to interpret. As per a 2018 Deloitte survey, 32 per cent of AI-aware executives have ranked the

ethical risks of AI as one of their top AI-related concerns. Therefore, many organisations are now beginning to pay close attention to ethical issues surrounding AI.

Microsoft kicked off the creation of a specific job profile to address AI's ethical concerns in 2018 by launching the position of an AI ethicist. Tim O'Brien, who had been working with Microsoft for 15 years as a general manager, took on this novel role.

WHO IS AN AI ETHICIST?

An AI ethicist deals with the ethical challenges of AI including sensitive projects and risk assessment. He attempts to effectively answer a fundamental question in this field which is not 'should' we use AI, but 'where' should AI be used. An AI ethicist usually works closely with the business unit and the legal unit of a company. As mentioned above, the bias in AI is a huge part of the profile as well. It is monumental, and thus today, we are seeing that in addition to AI ethicists, companies are also beginning to employ AI Biases Specialists, who define AI approach when it comes to performing AI operations in an unbiased manner.

Therefore, AI ethicists now closely focus on the ethical and social implications of AI and formulating AI frameworks that uphold the standard code of ethics within the company and beyond. The task of ridding AI of bias is also sometimes taken up by the AI ethicist himself if the company has tasked an AI Biases

Specialist separately to undertake this gargantuan responsibility. The role could also be handled by an existing leader in an organisation if companies don't have an individual working on AI ethics full-time. Companies deploying AI need an AI ethicist who will ensure that ethical principles in

Tim O'Brien at Microsoft works as a full-time AI Ethicist
