

Solution to a major AR glasses issue

A patent filed by Apple shows a device that can adjust the opacity of AR glasses, allowing better visibility. <https://dgit.in/nov19-51>

Hackers selling popular malware

Hackers are selling a trojan malware dubbed Raccoon Stealing to cybercriminals for as a monthly service. <https://dgit.in/nov19-52>

```

statusCode = 500;
    outResponse.
setPayload(<string>response.
detail().message);
    var re-
sponseToCaller = caller-
>respond(outResponse);
    if (response-
ToCaller is error) {
    log:printError("Error sending
response", err = responseTo-
Caller);
    }
    }
}

This last part is where we define the
backend services that will be invoked
by the load balancer.
@http:ServiceConfig {
    basePath: "/mock1"
}
service mock1 on backendEP {
    @http:ResourceConfig {
        path: "/"
    }
    resource function
mock1Resource(http:Caller
caller, http:Request req) {
        var responseToCaller
= caller->respond("Mock1 re-
source was invoked.");
        if (responseToCaller
is error) {

            log:printError("Error sending
response from mock service",
err = responseToCaller);
        }
    }
}

@http:ServiceConfig {
    basePath: "/mock2"
}
service mock2 on backendEP {
    @http:ResourceConfig {
        path: "/"
    }
    resource function
mock2Resource(http:Caller
caller, http:Request req) {
        var responseToCaller
= caller->respond("Mock2 re-
source was invoked.");
        if (responseToCaller
is error) {
            log:printError("Error sending
response from mock service",
err = responseToCaller);
        }
    }
}

@http:ServiceConfig {
    basePath: "/mock3"
}
service mock3 on backendEP {
    @http:ResourceConfig {
        path: "/"
    }
    resource function
mock3Resource(http:Caller
caller, http:Request req) {
        var responseToCaller
= caller->respond("Mock3 re-
source was invoked.");
        if (responseToCaller
is error) {
            log:printError("Error sending
response from mock service",
err = responseToCaller);
        }
    }
}

That's about it. We have success-
fully built a fully functional load
balancer which can handle a high
throughput of requests.

```

COULD THIS BE IT?

Ballerina certainly appears to be capable of becoming a generic programming language that most folks would easily catch up with. The syntax is quite familiar for folks coming from JavaScript, Go and Java. Then again, given it's Cloud Native approach, it's also very specifically targeted towards solving the problem of integration within a serverless architecture. It has built-in features that make streaming, security and threading quite easy to take care of. And, it's efficient given that one language does the job of multiple languages that are commonly-used in a single cloud solution. It's very new but with time, we could see greater adoption should it prove itself. 

*NULL VOID

*YARA the malware hunter

Folks over at virustotal have released YARA, a tool to help researchers identify malware. <https://dgit.in/devnov19-7>

*RTSSS

An introduction to real-time subsurface scattering to help better render skin textures. <https://dgit.in/devnov19-8>

*GNOME vs Troll

GNOME is going up against a patent troll in court for the Shotwell image management application. <https://dgit.in/devnov19-9>
