

### Apple warns iPhone 5 users

Apple sent full screen warnings to iPhone 5 users to update to iOS 10, to not lose out on key online features. <https://digit.in/nov19-83>

### Windows 10X leak

WalkingCat released a leak of Windows 10X shows a mix of desktop and mobile interfaces. <https://digit.in/nov19-84>

another part of the device. You now have improved 2.4 GHz band? Let's do away with the external antennae and slip everything inside in a less powerful manner. You can support 1024QAM? Let's limit the devices to 256QAM artificially and remove the firmware options to set it to a higher value. Got beamforming? Let's disable that and keep it for the mid-range and premium models. At the end of the day, manufacturers have a business to run and these business

decisions have been part and parcel of practically any hardware vertical and not just the networking vertical. You don't need to go far to see other such examples. Remember Intel's high-end Core i7 desktop processors have only 4 cores until AMD showed up with Ryzen? Intel was magically able to squeeze in two additional cores on to the same Skylake die. That's what router manufacturers also do in their own way. So even if Wi-Fi 6 were to be the Superman

of Wi-Fi, manufacturers will weigh him down with a massive necklace made of Kryptonite and charge you to have it removed. Naturally, it will be a lot many years before Wi-Fi 6 devices are no longer premium and get commoditised to the extent that it becomes the bare minimum standard. Until then you're not going to see a drastic change with the newer devices unless you're willing to pay a hefty premium. So much for being a game changer. **4**

## BUYING ADVICE

### CROSSFLASH GPU

**Q** Hi Agent001, I came across an article which mentioned that I can take the firmware from a Radeon RX 5700XT and flash that on to a RX 5700 to convert it into an XT and get more performance. I've never done such a thing before, so I wanted to know if it's safe and if I should do it or not?

-LK

**A** Hey LK, Often, manufacturers will use the same chip to produce multiple SKUs with the difference between the chip configurations enforced only via the firmware. Then there are times when the actual chip isn't good enough to be in a card so the manufacturers will see if it

Radeon RX 5700XT and RX 5700

can be used in the lower-end card. Then there are times when the chip is actually lasered out to ensure that crossflashing attempts do not yield in unlocking the entire chip. If it's the first case, then you

can go ahead and flash the BIOS from the 5700XT onto the 5700. However, if it's either of the other cases then you will end up bricking the graphics card. Certain graphics cards have multiple BIOS chips so that you can switch to the backup BIOS should a crossflashing attempt fail. If your card doesn't have this failsafe, then I'd advise you to err on the side of caution and not go ahead with the attempt. Your best bet would be to head over to multiple hardware forums and see if others have had any luck with the graphics card from the same manufacturing batch as yours. That way, you'll at least know if there's a chance that you can unlock higher performance from your graphics card.

Another key aspect you should check is if your graphics card has the cooling to handle the higher performance that would be unlocked. Both, the 5700 and the 5700XT have a single blower design on the reference cards, so you should be fine with those. All you'll need to do is check if the temperatures after the crossflashing operation are still within spec under load. If so, then congratulations will be in order.

### ROOM FOR A RADIATOR

**Q** Hey there! I recently got myself a PC with the following configuration.

- AMD Ryzen 5 3600X
- GIGABYTE X570 Motherboard
- 16 GB DDR4 RAM
- Samsung 960 Pro SSD
- 2 TB HDD

- Corsair H115i Cooler
- NZXT H500
- 650W MWE PSU

When I was building the PC, I realised that I cannot fit the radiator of the cooler in the cabinet. So I checked the NZXT web site and it says that 280mm radiator is supported but when I tried to install it, I could not. Please help.

-Sandesh

**A** Hey Sandesh, The NZXT H500 does indeed support a 280mm radiator on the front but it is a little tricky to install it. You

NZXT H500

will have to remove the vertical band from the cabinet so that you can easily place the radiator in the designated slot. Then, remove the mounting bracket for the radiator from the H500. Install the radiator+fans+bracket (in that order). Now, take this entire assembly and install it on the front of the chassis. Multiple folk have also faced this particular issue and NZXT even has a video on their YouTube channel for people to check how exactly they can install a 280mm radiator in the H500. You can refer to the same for additional information. **4**
