RIGHT ON TIME

The present is the perfect time to look at the future being done well in the past...

ow weird is it that this very sentence that you're reading right now (in your present) was written

by me at some point in your past. However, as I sit here writing it in my present, the act of you reading this article is in my future. In essence, this article exists in the past, the present and the future, all at once, and it's only by choosing a reference point in time that we know which one it is.

Time is relative, and it is confusing as heck as well. Which is why you end up with logical paradoxes the instant you allow for time travel. This is because time travel essentially defies the laws of physics, and in doing so, makes pretty much anything possible and also impossible, both at the very same time!

The typical example of a paradox is you jumping back in time and accidentally killing your grandfather. If your grandfather is dead, how could you ever come into existence? Shouldn't you disappear the minute

you kill your grandad? Is it even possible for you to kill your grandfather? Because if you were never born, then it's obvious that you couldn't have travelled in time to kill your grandfather in the first place! Known as the grandfather paradox, this is one of the many reasons in physics that makes time travel to the past seem impossible.

Time travel to the future? Well, that's a totally different kettle of fish, mainly because there are several ways in which this is possible. For one thing, just falling asleep in a cryo chamber, and waking up 200 years later, despite being the same age as you were when you went to sleep... that's a form of time travel. Then there are the effects of relativity, which allows for time dilation to occur when you travel very fast, or experience very large gravitational forces, for example. Wormholes are another (theoretical) way to traverse very large distances instantaneously, much faster than light would take to reach that point. In theory, you could view the past this

way, even if you couldn't interact with it. But we're looking at popular culture and trying to figure out who really covered the topic of time travel the best. In no particular order, here are our favourites.

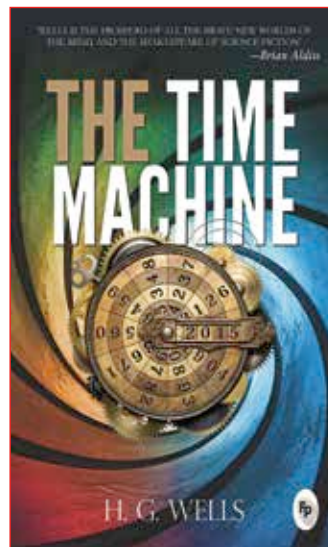

[MOVIE] BACK TO THE FUTURE

You can't talk about time travel and not mention this movie series. In no way was this the best depiction of time travel, but it certainly was the movie that made the idea popular all across the globe. There's nothing more than that to be said because we're sure you already know all about this franchise.

[BOOK] THE TIME MACHINE

While many of you might have learned about this story by the movie of the same name, it's the book that we love.

Published in 1895, and written by the brilliant H. G. Wells, this book did exactly what Back To the Future did, but only much earlier in time. There have been several movies (cinema and TV movies) and even comic books that were inspired by H. G. Wells' classic. In case you haven't read it, we recommend it. And no, it doesn't have too much in common with the 2002 film starring Guy Pearce, so it will still be interesting even if you have watched the movie.

[SHORT STORY] RIP VAN WINKLE

Written in 1819 by Washington Irving, this is a story of a man who falls asleep on a mountain side and wakes up 20 years later to find out that his wife has died and his daughter is all grown up.

[NOVELLA] A CHRISTMAS CAROL

A story by Charles Dickens, this is a Christmas-themed story about a crabbity old miser called Ebenezer Scrooge who is visited by the ghosts of Christmas past, present and
