

Global Propaganda

AS I SCROLL THROUGH THE ENDLESS POSTS ON MY FACEBOOK WALL,

all of which are about the recent Global Warming discussion that was sparked after a 16-year old child went on a rant in front of the UN Climate Action Summit, I can't help but ponder if it's all political propaganda. Every few months, you can see the same cycle which begins when some new study sponsored by a left-leaning organisation states that global warming is here and we might have already crossed the tipping point. Practically every simple action of yours impacts the world negatively. Did you make use of two matchsticks to start a fire? You're an Eco-Criminal! Did you not pay ₹30,000 extra and get the eco-friendly air-conditioner? You're worse than an animal! Did you have non-vegetarian food? You b@\$#@%d!

All of this propaganda is then countered by right-leaning organisations that sponsor their own studies which indicate that global warming is all a made up concept. Thank heavens that the right-wingers exist, else we'd have torn each other apart in the endless riots that may have ensued given all the doomsday garbage that the lefties would have us believe in. The bias becomes so clear that you really can't figure out whom to trust. The best course of action? Trust no one but your own eyes!

Over the decades, several climate scientists have decreed that if we don't reduce our carbon footprint, then we'll end up causing the sea-levels to rise. Even scientific predictions were made, based on historical data of rising ocean levels, that by the year so-and-so, the sea levels would have risen by a couple of meters. The year 'so-and-so' came and went but the water levels never rose by as predicted. In fact, we can say that the water was only affected by so-so. Climate science should probably be classified as pseudoscience given how wrong it's been proven to be over the years. People never changed their ways and carbon footprints have only gone up and yet, these predictions made by the climate scientists never came true! Had they been right, I should have been in an igloo in the middle of the Konkan Desert writing these words. Coastal cities such as Mumbai were to have been submerged not just during the monsoon but all year round! In the '70s, scientists had predicted that the next Ice Age would hit us in 50 years and yet, here we are 49 years later

in 2019, with no sight of the next ice age! What did, however, change is the estimates from the scientists. They keep moving their predictions forward by 20-30 years each time their previous prediction fails to come true. How convenient! So now, the next ice age is supposedly coming in 15 years. Yeah, right. I certainly believe THAT.

Also, where's the food shortage and all the famines that were supposed to have occurred by now? Crop yields are at an all time high. Practically every farmer makes enough money to buy a couple of Mercedes sedans and that's what they probably use to travel to Mumbai whenever they want to make their fake protests. Prices of commodities have certainly gone up but that's what naturally happens with inflation. You weren't expecting to continue buying bread for the next couple of decades for five bucks a loaf, were you? Be grateful that we have GMO crops which can produce much higher yield using the same amount of resources. Had we been using the same old grains that our ancestors had then we'd probably have seen a famine or two in our 25-year long lifespans.

The smartest minds of our time have been championing for accelerating all research efforts around space travel because it might have already been too late to save the earth and our only hope might be to find another home. They're in it for the money you see. They've since long figured out that a lot of panicked people would, without a doubt, pay ridiculous sums to be among the first space frontiersmen and frontierswomen. And there's no better time to cash in on these gullible ones. Lest not too much time pass and all the left-wing propaganda be exposed for what it really is – utter garbage! I sincerely hope that space travel does indeed become affordable and available to the masses. That way, we can pack up all these "climate scientists" and send them off to Jupiter's icy moon, Europa. That way, they'll actually learn what it means to be in an ice age as they attempt to stop their teeth chattering because of the -160 °C surface temperature. So they'll have some sense frozen into their skulls and when they do get back, we'll finally see some proper predictions. 

For those who're about to fire up their email clients and send a strongly worded complaint, I have only this to say. This is satire.

"Where's the food shortage and all the famines that were supposed to have occurred by now? ... Practically every farmer makes enough money to buy a couple of Mercedes sedans"
