

REDUCE YOUR IMPACT

HOW YOU CAN GO GREEN

Manish Rajesh | manish@digit.in

Technology has grown by leaps and bounds, even when it comes to helping fight climate change. We've seen major innovations in eco-friendly tech like solar energy and wind energy. All of these changes help fight climate change on a global scale. However, all of us can also contribute, by fighting climate change on a more personal level. You know what they say, every little bit helps. Here are a few ways in which you can reduce your own carbon footprint and go green.

SAVE PAPER

The best way you can go about reducing your personal carbon footprint is to look at your immediate surroundings and habits and see what you can cut down on. The very first thing you can cut down on that comes to mind is paper. Going paperless is easier now than it ever has been. If you're a student, taking notes electronically on a laptop or tablet, or even a phone, would help save a lot of paper. You can also cut your paper consumption by paying bills and making payments online. This way you've avoided having to print anything out. You can also use some innovative gad-

gets to help you to that end. The Rocketbook, for example, is one such gadget.

The Rocketbook is a reusable notebook. While it functions as a traditional notebook and you can take notes on it, once you've used up the book, you can erase everything and start over. It uses a special type of material in their pen and "paper". Using their app, you can directly upload the contents of the notebook

to the cloud to look over whenever you need to. Convenient and eco-friendly!

You can even look into digitising your existing documents. There are plenty of free services which can help you with that such as DropBox, and even Google Drive. The advantages to these services are that they're on the cloud, making them easy to access from anywhere without needing to be carried around. Also, they're incredibly easy to update.

PS: We're aware of the irony of being told by a print magazine to reduce paper usage. As far as possible we try and source paper from carbon negative companies who plant far more trees than they cut down.

VEHICLE MANAGEMENT

The next thing you can do is take a look at transport. Specifically, personal transport. Trying to avoid driving as much as possible is one way to reduce your carbon footprint, but we understand that it's simply not possible for everyone. In situations where it can be avoided, it would be ideal. The alternative is to use public transport. If more people adopt this, it would significantly reduce the number of cars on the road, which would not only reduce carbon emissions, but it would free up roads as well, and who doesn't want less traffic on the roads?

Next up, if you are someone who has to use your own vehicle, whatever be the reason, make sure that it's always well-maintained. Keeping your vehicle well-maintained will ensure that it's efficient, in terms of fuel consumption, and will curb harmful emissions as well.
