

THIS IS TECHNOLOGY, CULTURE AND SCIENCE WITH A DIFFERENCE, AND THAT DIFFERENCE IS USUALLY ENOUGH TO MAKE MOST NORMAL PEOPLE GO "WTF?"

ALT this month:

This month we look at some majestic structures around the world made from LEGO bricks, we explore some people who actually have the dubious honour to have diseases named after them and much more!

Volkswagen's bestselling product

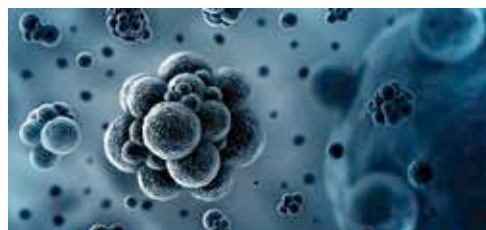

Volkswagen's bestselling product is not the Tiguan or the Polo, but a humble sausage with a secret recipe originally made for workers in its factories in Germany. The sausages are so popular, that they are sold in supermarkets across the country. The sausages are grilled, then mixed with curry and ketchup, and are called currywurst.

WHAT'S NEW

How much do you pollute by existing?

Even if you reduce your existence to merely the act of breathing, you add a considerable amount of pollution to indoor spaces, such as offices. Personal hygiene products such as cosmetics and deodorant also introduce chemicals to the environment. These findings were made by a team of researchers trying to improve the air quality within offices, to increase productivity. A team from Purdue University rigged office spaces with thousands of sensors for the study. The two most important factors contributing to the chemistry of indoor air were people and ventilation systems. The focus of the research was volatile organic compounds, which typically originate from human beings, and the concentra-

tions of such chemicals are higher indoors than outdoors. While the chemicals are not outright toxic, they do have long-term negative effects, because of just how much time people spend in offices. It was found the volatile organic compounds can have a drastic effect on worker health and productivity.

7,000 years ago, humans lost their jobs to something new

The total number of jobs that are expected to be created in AI and robotics are expected to outnumber the ones lost, but there are skilled people who are going to be rendered obsolete. Such a thing has happened 7,000 years ago because of the domestication of oxen. A single ox in a field could do the work of 10 men. Therefore, the oxen became valuable on land, with the people

becoming obsolete. Only the people who owned land and oxen could acquire more land and oxen. Prior to the revolution, the land was divided into small plots, with

each individual labouring on their own portion of land. By 2000 BC, only the families that already owned the land were able to pass them on to their children, while other families were landless. The system transformed from where human labour was the limiting factor for production, to one where the availability of the land was the limiting factor.

The code that changed the world

From the decision that allowed code injections in C, to the origins of email, to the code that landed men on the Moon, you can check out some of the most influential pieces of code ever written. The first binary code was written in 1725 for a loom, and this hasn't changed since.

What would happen if each of us planted a tree?

A physicist made the calculations to figure out the impact if every human being planted a single pine tree. The results showed that, about 6 per cent of the carbon dioxide in the atmosphere and would require only 1,15,872, about the total area of the state of Odisha.

Bill Gates gave away \$35 billion this year

Despite that, his net worth did not fall, because of his investments. About 60 per cent of his wealth is in stocks or index funds, which is aggressive for his net worth. However, everyone shouldn't invest in the same things as the second wealthiest man on Earth.
