Tile Sticker

In a similar vein to Apple's upcoming Tags, pioneers in the industry, Tile, have gone ahead and released their own tracking device – and it's a sticker. It's even called Sticker. The Tile Sticker is a waterproof tracking device that uses an adhesive to attach to objects. The adhesive is made in collaboration with 3M, and is designed to bond to most metal and plastic surfaces. If placed on a clean, flat surface, Tile promises that the bond should last for a good three to five years. The Tile Sticker can be tracked via Bluetooth, up to a range of 150 feet.

Tile is also enhancing its existing range of tracking devices, which include the Tile Slim, the Tile Mate and the Tile Pro, all of which are getting range extensions. The Slim has gotten even slimmer, now as thin as a credit card. It actually pretty much looks like a credit card. It's designed to slip into your wallet and track it in case of theft. The battery life on Tile's trackers is usually around three years. The range for the Slim and Mate is 200 feet while the Pro has a range of 400 feet.

Tile Stickers are priced at \$40 for a pack of two, while the Slim is priced at \$30. The Tile Mate and Pro, the square-shaped fobs that Tile first became famous for, are priced at \$25 and \$35 respectively.

Porsche flying taxis

German automaker, Porsche, has teamed up with American aerospace company, Boeing. The goal? Populating the skies with flying taxis.

Both companies have come together to look into flying taxis and see if there's a market for such a premium service. We're sure there will be quite a few takers. We all know about Porsche's capabilities on the road. They now want to bring premium mobility to the skies as well. We've even had glimpses of what they can do over (and under!) water. Maybe underwater taxis are next if this succeeds? Who knows.

Steps towards the goal are already set in motion, with a team of engineers, from both Porsche and Boeing, already working on concepts and designs. The project is still in its very nascent stages, so nothing is set in stone, including the design. However, both teams expect that the project will ultimately take off. No pun intended.

Keeping climate change in mind, the vehicles will also be fully electric and there should be no doubts that the vehicles will score high in the looks department as well. The first prototype for the air taxi is expected to drop in 2020; keep an eye out for that.

Skydio 2

Flying Drones isn't exactly an easy feat to accomplish. There's quite a bit you need to a grasp on, if you don't, chances are you're going to crash your drone. And drones aren't cheap, so you usually want to avoid that at all costs.

However, what if the drone just flies itself? The Skydio 2 does just that. It can fly and manoeuvre itself, no problem, all while avoiding any obstacles it might encounter on the way. It improves on its predecessor, the Skydio R1, in every way. It's lighter, quieter, faster and even lasts longer at 23 min-

utes. It comes with a host of 4K Sony cameras, which help with recording video and capturing photos, in addition to navigation. There are optional remote controls if you're in the mood for piloting the drone, otherwise, it's bound to your phone in self-flight mode. The drone can hit speeds of almost 60 km/h and Skydio claims that

their second-gen autonomy engine will definitely keep the drone from crashing into anything, backed with a warranty at that.

You can grab a Skydio 2 of your own for \$999, which is definitely pricey, but at least it's less than half the price of its predecessor.
