

Hypergiant Eos Bioreactor

About 72% of all greenhouse gas emissions in the atmosphere is made up of Carbon Dioxide, or CO₂. With global warming on the rise, it's more important than ever to combat the rising temperatures and greenhouse gas emissions.

The process of photosynthesis is one of the things that captures CO₂ from the atmosphere. Photosynthesis

falls under biosequestration. Meaning, it is a method to capture and store CO₂ using biological processes. Hypergiant, an A.I. Company from Austin, Texas, thinks they've come up with a way to speed up this process, and make it more efficient, by using Algae.

Algae is incredibly efficient when it comes to CO₂ consumption. Additionally, it also produces biomass in the process which can be used as fuel. On top of that, it doesn't compete for land with other crops, and there's no need to displace forests for them, they coexist alongside them peacefully.

The Eos reactor is still in its early stages, but what we do know is that this algae-based bioreactor can supposedly harvest the same amount of CO₂ from the atmosphere as an acre of trees, and at only 3-feet by 3-feet by 7-feet, this could essentially revolutionise our fight against climate change and the associated perils.

Bugatti Atlantic

We already know that Porsche is working on flying taxis. Bugatti on the other hand, wants to make hypercar-inspired boats. Hyperboats? Hyperboat sounds pretty cool.

They've already got a prototype, dubbed the Bugatti Atlantis, which is based on the Bugatti 1936 Type 57 SC Atlantic. The Atlantis is being designed by Etienne Salome, who is no stranger to designing breathtaking hypercars. He's the designer of the Bugatti La Voiture Noire after all, which is the most expensive car in the world at \$12.5 million. It looks like he now has his eyes set on the seas.

The renders of the Atlantis look gorgeous, as was to be expected, but there's more to the design than just looks. The most standout feature of the design are the flow-through hulls, which allow air to pass through the hull, which in turn increase stability and reduce drag. This idea and flowing design is inspired by F1 race cars.

The boat is powered by a pair of 440-horsepower Volvo engines and it can reach a top speed of 60 knots. That's around 110 km/h. Bugatti plan to reveal the yacht at the 2020 Monaco Yacht Show.

SPA Wearable Skin

You might be wondering why wear skin when you've already got skin. Well, this skin is meant to be worn if you want to touch things in VR. And we mean, actually touch things. Or at least, feel like you are.

Scientists at the Swiss Institute of Technology in Lausanne have invented an incredibly thin second skin that can adapt to a moving body. The skin has been designed to provide haptic feedback that feels natural, without electronic vibrations that are otherwise used in haptic feedback devices.

The skin is less than 500 nanometers in thickness, and is equipped with pneumatic actuators. This is what makes you actually feel like you're touching something real. The skin is also integrated with sensors that sends data which is used to modulate pressure.

The actuators in the skin, when activated, inflate the skin slightly to give you the illusion of touch. They aren't affected at all by body movement, but also won't stop you from moving your finger beyond the surface of the virtual object.
