

DROOLMAAL

Sony Crystal Cinema

If having a big TV is not enough, and you want the largest display in the world, look no further than Sony's Crystal Cinema display. At 63 feet wide and 17 feet tall, this is a monster of a display. But, you've got to have almost \$6 million in your pocket to afford it!

Showcased at the NAB trade show earlier this year, the Sony Crystal Cinema is double the size of Samsung's 'The Wall Luxury', which is huge 8K TV in its own right. Similar to 'The Wall', Crystal Cinema also uses micro-LED modules, each measuring 16x18 inches in size and 360 x 360 resolution with three tiny LEDs for each pixel. While it works like OLED, it's much brighter, creating 1000 nit of brightness. It also has better contrast than regular OLED displays.

The Crystal Cinema display actually has variants when it comes to size and resolution. The largest, and also the one that costs almost \$6 million, features a resolution of 16K! We've already mentioned the dimensions above. We're assuming, if you live somewhere that can actually house the TV, you can probably (maybe) afford it. If

you're actually interested in getting your hands on the Sony Crystal Cinema, you'll need to get in touch with Sony since only certified dealers will sell the TV, thanks to the special training that's required to actually handle them.

SPECIFICATIONS:

HDR with high brightness (1,000 nits) | 10-bit grayscale | Precise color reproduction | Extraordinary color gamut - 140 percent of sRGB | High frame rates up to 120p | Nearly 180-degree viewing angle | Spectacular 3D | Non-standard aspect ratios | 99 percent black surface area for delivering high contrast and high resolution

Fujifilm GFX 100

Dhe Fujifilm GFX 100 is a 102-megapixel, \$10,000, medium-format, mirrorless camera. Yes, you read that right, 102 megapixels. One can only imagine the colossal size of the RAW files this thing can create.

The GFX 100 is designed for professionals. We're assuming very rich professionals at that. For a large camera, it's actually pretty compact, and supposedly comfortable to hold. Additionally, it comes with a vertical grip, for you know, vertical portrait-style picture-taking.

The camera comes with three different screens. Which sounds like plenty, but you're paying \$10k for this, you want at least three screens. You have an always on electronic ink (E-Ink) display on the top of the camera, on the back you have an LCD screen, which you can tilt around as needed, and below that is an illuminated panel which shows off a bunch of settings such as exposure, film simulation, white balance and more. It's quite convenient really.

The GFX 100 has two SD card slots, which support high-speed UHS-II media. You can fit about 1200 RAW images on a 128GB SD card.

For a medium-format camera, the GFX 100 is quite user-friendly and versatile. It has simplified controls, comes with an autofocus system and five-axis image stabilisation.

Is it worth the \$10,000? If you can actually afford one, you can't really go wrong with it. Are there better options? Probably.

SPECIFICATIONS

SENSOR: 102MP medium format CMOS, 43.8mm x 32.9mm | **IMAGE PROCESSOR:** X-Processor 4 | **AF POINTS:** 3.67m phase AF points, single point, zone, wide area AF | **ISO RANGE:** 100 to 12,800 (exp. 50-102,400) | **MAX IMAGE SIZE:** 11,648 x 8,736 | **METERING MODES:** Multi-segment, centre-weighted, spot, average | **VIDEO:** 4K UHD/DCI4K at 30p, 25p, 24p | **VIEWFINDER:** EVF, 5.76m dots | **MEMORY CARD:** 2x SD/SDHC/SDXC (UHS II) | **LCD:** 3.2-inch tilting touchscreen, 2.36m dots | **MAX BURST:** 5fps | **CONNECTIVITY:** Wi-Fi, Bluetooth | **SIZE:** 156.2 x 163.6 x 102.9mm | **WEIGHT:** 1,400g (body only, with 2 batteries and SD card)
