Noise ColorFit PRO 2

The Noise ColorFit Pro 2 is the successor to the ColorFit Pro from Noise and their latest entrant into the budget smartwatch category. In terms of looks, you can tell right away that it's inspired a lot by the Apple Watch, with a single crown on the right side of the watch face, and an otherwise minimalist and plain look.

Unlike the ColorFit Pro, the ColorFit Pro 2 features a touch display. Like we mentioned above, there's only a single button on the right side of the watch. This crown/button can be pressed to return to the watch face, close apps, and go back in menus. It can also be pressed to wake the watch if the screen is off or in rest mode. This is if you've set it not to wake when you lift the screen to face the watch.

Holding the button down can only be used to turn on the watch. To turn it off, you need to head to the watch settings.

Swiping to the left and right of the ColorFit Pro 2 watch face reveals a few options to you. Swiping right reveals four options, here you can turn on the automatic heart rate monitor, enable or disable the display coming on when lifting the screen, turn on/off DND and location features. On swiping left, you have the sports mode, heart rate, breath, alarm, music, stopwatch, settings and sports record options. Sports mode features timers, heart rate and step measurements catered to specific sports. The rest are pretty self explanatory.

Holding your finger down on the watch face will allow users to choose between one of five watch face options available. You can access the watch faces through the settings option as well.

FiiO M5

The latest digital media player from FiiO, the M5 sports a compact form factor that is designed to be able to accompany you where ever you go.

It's even designed to be more than just a digital media player, as it features things one would normally see on a smartwatch. In addition to having a Hi-res Bluetooth receiver, and a microphone for recording, the FiiO M5 also features a pedometer and a watch.

The M5 comes with it's own clip case, which you can slide the M5 into, in order to conveniently clip it to your pockets or your clothing.

The M5 can be worn as a watch as well, however, the silicone watch band is sold separately, so we can't say much about how it feels to wear. Considering that FiiO expects the M5 to be worn during workouts, we're assuming they've done something to ensure the band doesn't slip when it gets wet, due to sweat.

In terms of size, the M5 is even smaller than the FiiO M6, and looks about the size, if not slightly larger, than most smartwatches. It weighs just 38g and is easy to carry around. The front and back panel are both fitted with 2.5D glass on CNC machined aluminum. Overall, it features a very sleek and clean look.

For the button layout, there's the volume bar and the power button on top, and an aux port. Other than that, no physical buttons, a touch layout. The M5 doesn't have any storage of its own, so you need an SD card in order store and play music and even to install new firmware.

In terms of audio quality, a lot relies on the IEMs you decide to pair with this compact media player. The FiiO M5 is definitely well endowed in the hardware department. The increase in the number of features on the M5 hasn't hurt that.
