luetooth is a wireless technology used for data communication between multiple mobile devices. The

simplest example and excuse us for being so rudimentary – if you have a smartphone and would like to transfer images to your dad's smartphone, you can initiate the process via Bluetooth, essentially avoiding the use of data cables and computers. Windows 10 ships with support for Bluetooth and you can transfer files from your phone to your PC and vice versa. Bluetooth makes use of short-wavelength UHF radio waves ranging from 2.400 to 2.485GHz. The technology was initially developed as an alternative to RS-232 data cables. Nowadays, every smartphone available on the market ships with Bluetooth support. As a

Bluetooth 5.1 offers seamless, interruption-free connectivity

user, you need not have to know the technical angles but you should know about the various features bundled with the latest release, Bluetooth 5.1. Bluetooth 5.1 is equipped with several enhancements including improvements in the stability of the connection. The latest version provides real-time data in addition to proximity sensing and location specific information. This article provides a succinct coverage about everything you need to know about Bluetooth 5.1.

WHO

The Bluetooth Special Interest Group (SIG) is responsible for the

management and development of the Bluetooth wireless technology. As of writing this, the Bluetooth technology is owned by over 35,000 affiliated companies across telecommunication, computing, networking, and consumer electronics. Even though IEEE standardised Bluetooth as IEEE 802.15.1, the organisation no longer maintains the standard. The Bluetooth SIG has drafted the core guidelines and the manufacturers should adhere to them in order to market the relevant device that features Bluetooth technology in any way. According to estimates, nearly 920 million units of mobile devices
