

Uber loses license in London

London's transit authority refused to renew Uber's license to operate over passenger safety concerns. <https://dgit.in/dec19-11>

Deleted unused apps

Regularly deleted unused apps from your Android device can save your phone from vulnerabilities. <https://dgit.in/dec19-12>

in various formats are embedded with Bluetooth circuit chips.

WHEN

Bluetooth 5.1 (<https://dgit.in/Bluetooth>) was announced by the Bluetooth SIG on January 21, 2019.

WHAT

Bluetooth 5.1 standard ships with plenty of new improvements to reduce the power consumption in a definitive manner. Let's delve into the topic to find out more.

DIRECTION FINDING

Bluetooth 5.1 includes Direction Finding, which helps the devices to identify the direction of Bluetooth signal transmission accurately. The new feature works by combining Angle of Arrival (AoA) and Angle of Departure (AoD) methods respectively. The Bluetooth Low Energy (BLE) controller in the recipient device will generate a set of data, which is used to calculate the directional angle between the recipient and transmission device. The generated data can be used to create Real Time Locating Systems (RTLS) and Indoor Positioning Systems (IPS). The main purpose of the Direction Finding is to enable you to find out the lost device easily.

GATT CACHING

The attributes caching integrated with the Generic Attribute Profile (GATT) has been improved in Bluetooth 5.1 standard. Hence, your device will work faster with stable connectivity and low power consumption. The cache can be retained across connections, provided the client has a trusted relationship with a server. The end result is the non-repetition of the discovery process ending up in fewer connection drops and enhanced battery life.

RANDOMIZED ADVERTISING CHANNEL INDEXING

Bluetooth 5.1 provides support for Randomized Advertising Channel Indexing, which ensures that devices

don't have to follow the strict protocol during the transmission of the data packets. The devices have been given the freedom to select appropriate channels randomly, which reduces advertising packet collisions.

PERIODIC ADVERTISING SYNC TRANSFER

The Periodic Advertising Sync Transfer (PAST) included with Bluetooth 5.1 provides the ability for the devices to share the data that has been scheduled across multiple devices such as smartwatches and fitness trackers.

specified when the rules are violated. Interestingly, the Unit Keys feature has been removed from Bluetooth 5.1. That being said, the process involved in the transfer of content via Bluetooth is same. However, you will find considerably more speed and less heat during transfer of data using compatible devices. You can expect new devices such as smartphones, tablets and laptops to come equipped with Bluetooth 5.1 by Q1 2020.

CONCLUSION

With Bluetooth 5.1, you can easily transfer images and videos between

Bluetooth 5.1 Direction Finding is getting rave responses across the globe

Some of the other improvements included with Bluetooth 5.1 are HCI support for debug keys, Sleep Clock Accuracy Update, addition of the ADI field in scan response data. The QoS and Flow Specification can now interact with each other, with the capability to classify the host channel. The specifications are updated in such a way that the behaviour can be

multiple mobile devices. Even though the process involved is pretty much identical to the existing Bluetooth 5 standard, the core advancements are in the internal coding. Bluetooth 5.1 has been designed in a way that devices consume less heat coupled with improved connectivity. Sounds like a good enough upgrade to us. Happy connectivity!
