

a PDF to other third party apps, including Google Keep, Discord or WhatsApp.

AUTOMATICALLY CLOSE SAFARI TABS

If you don't have the habit of closing Safari tabs, they tend to accumulate and generally slow down the phone. Apple offers an option to automatically close down old tabs. Go to Settings>Safari>Close Tabs and select a duration. The options are daily, weekly and monthly.

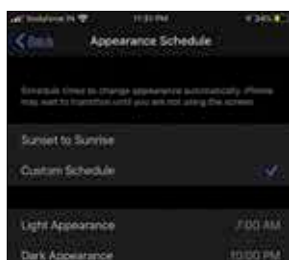

ANONYMISE SIGN INS

Some applications will offer a new Sign in with Apple option, which is great as you get granular control over the type of information you want to share with the developer. Additionally, if the application requires an email address, but you do not want to give it your personal address, then Apple allows you to create a random address on the spot. Be careful though, while useful, the emails get forwarded to your iCloud email account.

SCHEDULE THE DARK MODE

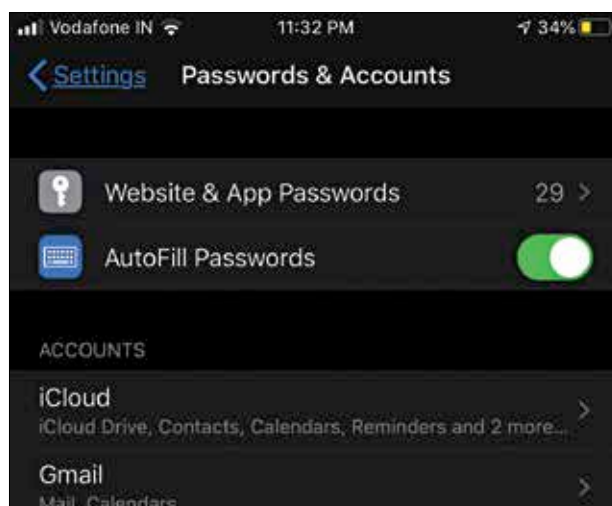

Yes, the iPhone now has a dark mode, a feature for which more than 3 billion eyeballs are thankful for. There is a way to schedule as well. Go to Settings > Display & Brightness and toggle Automatic. Now, there are two options available. You can either set the dark mode to track the local sunrises and sunsets, or set up a custom schedule. To set up the custom schedule, tap on Options then select the time at which Light Appearance starts, and the time at which Dark Appearance starts. This is distinct from the Night

Shift settings, which displays a warmer tone on the screen after the Sun goes down.

PREVENT AUTO FILLING PASSWORDS

If you are one of those who can remember constantly evolving multiple passwords, the new randomised password creation feature can be painful. This is because you actually have to repeatedly delete the password that Apple automatically fills in. Go to Settings > Passwords & Accounts and toggle AutoFill Passwords to prevent Apple from filling in passwords automatically. Note that choosing this option also prevents the device from automatically entering in your saved passwords. There is currently no way of preventing the iPhone from only generating new passwords.

STREAM TO MULTIPLE AIRPODS

This is perhaps the most obscure trick in the list, but we will try to not be judgemental and just tell you how to do it. First, go to paired Bluetooth devices and connect the device to a second pair of AirPods as a "guest" device. Then head to AirPlay, and select the additional pair. Now, up to four people can listen to the same song using the AirPods.

 **3D TOUCH**
3D touch is on its way out and none of the new devices support it. It had a clunky implementation right from the beginning, with Apple never fully committing

to the feature. As a result, the UI does not really require it. In some of the older phones, the persistence of 3D touch can cause all sorts of unwanted options to crop up in the UI. Now, Apple offers a simple way to disable 3D touch altogether, even if the hardware supports it. Go to Settings > Accessibility > Touch > 3D & Haptic Touch and toggle 3D Touch to turn it off. This panel also allows you to fine tune the controls for 3D touch, including adjusting the sensitivity and duration for a 3D touch detection. Right at the bottom, you can test the sensitivity to make sure that you have tweaked the settings just right.

TRACK FOOD DELIVERY WITH A SINGLE TAP

Over regular usage of your apps, frequently repeated behavior shows up as Actions in the Shortcuts app, provided the app supports it. One of the nifty features is the ability to track an order from Swiggy with a single tap. Just create a new Shortcut, and then select the Track status of your order Action. Then, tap on next to select a name and a custom icon for the Shortcut. Tap on Done. Now every time you
