

swipe left from your home screen, you will see a box with all the shortcuts. From here, you can just tap on the shortcut to directly track an order on Swiggy.

MICROMANAGE YOUR BATTERY

This shortcut is based on shortcuts by Reddit users wexford001 and Enclavean, and is particularly useful for devices with low battery health. The phone enters into low power mode at 80 percent charge itself. If the battery reduces to below 20 percent, the device shows an alert, and then sets brightness to zero, turns off Bluetooth, Wi-Fi and mobile data. All the values used in this shortcut can be tweaked according to requirements. We are providing one example here to show the complexity and depth of the Shortcuts app.

Get **Battery Level**

If **Battery Level** is less than **80**

Turn **Low Power Mode** **On**

If **Battery Level** is less than **20**

Show alert **Go Dark**

Set **Brightness** to **0%**

Turn **Bluetooth** **Off**

Turn **Wi-Fi** **Off**

Turn **Mobile Data** **Off**

Otherwise

Turn **Bluetooth** **On**

Turn **Wi-Fi** **On**

Turn **Mobile Data** **On**

End If

Otherwise

Turn **Low Power Mode** **Off**

Turn **Bluetooth** **On**

Turn **Wi-Fi** **On**

Turn **Mobile Data** **On**

End If

SHARE A SHORTCUT

If you have created a shortcut that you are really proud of, and want to share them with your near and dear ones, or the internet at large, Apple offers an easy way to do so. Just tap on the three dots on the top right of the shortcut, and then the share icon along the bottom. For example, the shortcut for battery micromanagement shown above can be downloaded from <https://dgit.in/btrymgmt>. This menu can be used to duplicate a shortcut, to make variations of it.

GET MORE SHORTCUTS

There are a lot of helpful

shortcuts out there, and the r/shortcuts subreddit has a steady stream of new and interesting ones.

If you need help troubleshooting a shortcut or automation that you have created, then that is best done through the very helpful community on the Discord server (<https://discord.gg/2rtjnn>). Macstories has a very helpful and curated list of shortcuts, sorted by various sections. These can be viewed at: <https://dgit.in/msst>.

USE AUTOMATIONS

The Shortcuts app also allows you to set up automations, which are triggered automatically when certain conditions are met. We set up an automation where every time the camera is opened, the screen brightness is set to maximum, the phone is set to airplane mode (so that there are no calls even from those who can get past the DND mode), with Bluetooth and Wi-Fi turned off.

This allows you to dedicatedly record videos without any interruptions. However, Automation and the Shortcuts app currently do not allow the closing or exiting of an app as a trigger. A workaround is to use another action to revert all the changes, such as toggling the airplane mode or turning on Wi-Fi.

ALL NEW CAMERA APP

The Photos and Camera apps both have got significant reworks. The Camera app is now much more powerful, with a video editor thrown in. The video editor allows you as much freedom and control as the photo editing app, including options to straighten and rotate, which were so far only available in third party applications. There are white balance adjustments now available, but they are split up into two options next to Vibrance, called Warmth and Tint. The Warmth slider goes from blue to yellow, while the Tint slider goes from green to

magenta. Additionally, every time you tweak an option, there is a circular indication that persistently shows the position of the slider. You can directly tap on a particular option, say Warmth or Vibrance, to toggle them being applied with a single tap. There are new sliders for Sharpness, Definition (great for documents) and Vignette.
