Leaks indicate that an upcoming Xiaomi smartphone will support 66-watt fast charging. <https://digit.in/dec19-06>

Teardown: AirPods Pro

An array of new features but still fundamentally 'unrepairable'

Dhriti Datta | dhriti@digit.in

The sole openly replaceable component

We finally get a pair of silicone eartips with the AirPods Pro. Alas! The new AirPods aren't compatible with any other typical silicon tips. There goes a chunk of our toiled-for money! Fortunately, Apple has been slightly considerate and offer replacement tips for just \$4 (approximately ₹280). These tips do have a larger mouth for sound output than typical ones.

A button-cell battery

Upon prying open the earbuds, a button-cell battery reveals itself, the form factor of which is wildly different from the non-Pro versions. The 0.16Wh battery is held by a soldered cable which is not easily replaceable. The battery also looks suspiciously similar to the ones found in the Galaxy Buds. However, this battery is a significant leap from the 93 mWh batteries featured in the AirPods 2.

A large driver and an internal mic

A transparent plastic brace secures the relatively large driver of the AirPods Pro in place. When you lift the driver, a microphone rests there which listens to the insides of your ear. This is the very microphone that is used to automatically adjust volume levels of whatever you're listening to and determine whether the tips fit perfectly. You can also see the voice coil which moves the speaker cone to pump music into your ears and also creates the noise cancellation effect.
