

Power Bank and hand warmer?

Xiaomi's new power bank is also a hand warmer that can get as warm as 52 degrees. We're not kidding. <https://digit.in/dec19-26>

Facebook and Insta outages

Both Facebook and Instagram experienced drawn-out outages on the eve of Thanksgiving. <https://digit.in/dec19-27>

ZOTAC GTX 1660 Super AMP

More Supers emerge

T

he competition in the mid-range has further intensified with NVIDIA

launching additional GPUs today in the form of the NVIDIA GTX 1660 Super and another one, the NVIDIA GTX 1650 Super, will be launched later in November. Both cards are for the GTX 16-series (i.e. the ones without hardware accelerated ray-tracing but later received support through a driver update) cards with seemingly moderate bumps in performance. Both cards are AIB-only which means you will not be seeing any NVIDIA Founders Edition graphics cards for these. Today's review is courtesy of the ZOTAC GTX 1660 Super AMP Edition card which is going to be retailing for ₹22,590/- in India.

Price
₹22,590

design only needing 125W which could only mean that the card might pull around 150 W or higher from the PCIe connector. Or it could simply be a design choice to reduce load per cable.

From the bottom you can see the three heatpipes snaking into the finstack which makes contact with the GPU, memory chips and the MOSFETs. Upon removing the cooler assembly, we can see how much of the card is occupied by the PCB. There's a good inch and a half of excess space which is used to accommodate the cooler assembly. Also, the connector is quite recessed into the top part. We didn't face any issues plugging or unplugging the card despite this deep recess. If you are using custom cables, this might look better since the connector will be hidden from view.

The cooler assembly has two 90 mm fans sitting atop a thick finstack with three heatpipes spreading the heat from the GPU and the VRM circuit. On the bottom of the cooler assembly, there's a copper base plate to make contact with the GPU and the heatpipes are spread across the heatsink. Lastly, there's the GPU at the heart of the GPU which is an NVIDIA Turing TU116-300-A1 surrounded by eight Micron MT61K-256M32JE-14 chips for the VRAM.

Performance

Considering that the specifications of the GTX 1660 Super is the same as the

GTX 1660 except for the change in the memory configuration, it'll be interesting to see how it pans out across different resolutions. We, unfortunately, don't have the numbers for the vanilla GTX 1660, so we can't really say how much of a difference there will be with respect to that GPU but we do have a GTX 1650 and a 1660 Ti to compare against.

The 1650 is left in the lurch by the new GTX 1660 Super but what's more interesting is to see that the GTX 1660 Super equals the GTX 1660 Ti

in most of the benchmarks. The 1660 Ti certainly has a slight advantage of say 3-5 FPS in some titles but that's not enough to justify the price difference. It seems almost as if there's no need to get the 1660 Ti for most of the games that we've tested.

Bottomline

The GTX 1660 Super might be a step down from the 1660 Ti in terms of specifications but if you look at the performance numbers then it equals the GTX 1660 Ti in practically all the games we've tested. Even the pricing is similar considering that you can get a GTX 1660 Ti for ₹23,500 whereas this particular card costs ₹22,590. There are very few games where the 1660 Ti can even get ahead of the 1660 Super and when it does, it's barely worth paying the extra thousand bucks for.

—Mithun Mohandas

SPECIFICATIONS

CUDA CORES: 1408 | ROPS: 48 | CORE CLOCK: 1530 MHz | BOOST CLOCK: 1845 MHz | MEMORY CLOCK: 1750 MHz | MEMORY BUS WIDTH: 192-bit | VRAM: 6 GB GDDR6 | TDP: 125 W | WARRANTY: 5 Years.

Specifications

The specifications of the GTX 1660 Super is pretty much the same as the GTX 1660 with just one key difference, the memory has been bumped up from GDDR5 to GDDR6 bringing with it increased bandwidth that will help with gaming at higher resolutions. The ZOTAC GTX 1660 Super AMP, going by its name, comes with a factory overclock which puts the boost clock at 1845 MHz which is 60 MHz over the boost frequency of the reference specification.

Build

Since we have no idea what the reference design looks like, we can't exactly opine on how much of a modification ZOTAC has made to this particular graphics card. However, with AMP Edition cards, ZOTAC does make quite a few changes to the design. The card comes with a backplate that wraps around the edges to provide a little extra rigidity. You can see the ZOTAC GAMING logo emblazoned on the top along with the GeForce GTX branding. The card uses an 8-pin power connector despite the reference
