DEVELOPER OPTIONS ON ANDROID DEVICES ARE A SET OF FEATURES that allow users to configure system behaviours. By default, these dev options are hidden on Android devices since it was specifically designed for individuals who are interested in testing additional options that can impact a phone's performance. However, casual users can also unlock Developer Options on Android in order to unlock your bootloader, alter the animation speed, or create a desktop backup password, to name a few.

Before we dive into a host of developer tools on

Android, let's get started with how you can enable Developer Options on your very own Android device. Firstly, head over to your Settings app, select System (for Android 8.0 or higher, others proceed to the next step), scroll to the very bottom and find 'Build number' and then tap on this option 7 times consecutively. When you return to the previous screen, you will find Developer Options are now

available for you to access with the Settings Menu.

***Note:** On Android 4.1 and lower, Developer Options is already available by default.*

In the Developer Options window, toggle the feature on. The device will display a massive set of settings and features you can mess with on your Android smartphone. However, ensure to carry out actions in Developer Options carefully. Do not attempt to venture into something that you don't fully comprehend since it might end up messing with your smartphone.

Here's a bunch of tips and tricks to make the most of these dev options.

HIGHER QUALITY RENDERING IN MOBILE GAMES

If you're an avid mobile

gamer, you can take your gaming experience to a new level with Developer Options. You can force enable MSAA (Multisample anti-aliasing) to obtain higher-quality graphics rendering in OpenGL 2.0 games and apps. This feature is often turned off by default in numerous games to avoid draining your device's battery quickly. But you can choose to turn it on here and enjoy considerably better gaming visuals and smoother performance. To enable this, head over to Developer Options and tap on Force 4x MSAA to enable it.

MOCK LOCATION

In order to spoof your Android GPS location, to maybe play Pokemon Go in some other country or avail services not available in India, you can use Developer Options. Other than these use cases, you can also alter your GPS location to test apps, ROMs and other services. There are a plethora of apps on the Play Store to fake your location. Choose one and install it on your device. Next, you need to head over to Developer Options and find 'Select mock location app'. Choose the app that has location spoofing abilities which you downloaded earlier. Now, the app is capable of tricking your phone into

Activating MSAA will enhance gaming graphics on your phone
