

thinking it is located in a location of your choosing. You can also use this with social media apps such as Snapchat or Facebook to access filters or other features that are not available in your location.

DISPLAY CPU USAGE AS AN OVERLAY

Ever wondered what's going on behind the scenes on your Android device? How your CPU is handling the tasks and apps on your phone, maybe? You can enable 'Show CPU usage' in Developer Options on Android which will overlay all the processes that are currently running on your screen. The entries are relayed in order of their current CPU load and your device's overall CPU usage is displayed as a bar graph at the top of the screen.

Hi-Fi audio codecs can deliver better audio quality

and you will see an array of options all the way from the standard SBC to Hi-Fi codecs such as aptX, LDAC, and AAC. You can switch to any of these if your Bluetooth device supports multiple.

GET ACCESS TO HI-FI CODECS

Google added the support for Hi-Fi audio codecs with the launch of Android Oreo. When you are using Bluetooth devices that can support these codecs, your phone will automatically switch to the corresponding codec to deliver higher-quality audio. However, if your Bluetooth headset is capable of supporting multiple codecs, you can simply pick the codec you prefer through Developer Options. Navigate to 'Bluetooth audio codec'

FORCE GPU RENDERING

If you are experiencing any sluggishness when it comes to graphics in mobile games or apps, you can help alleviate this with Dev options. As of Android 4.0, your device's dedicated GPU is used to render 2D objects by default. Still, some apps haven't been updated to take advantage of this feature which is a much speedier method of rendering graphics on your mobile device. If an app seems to render graphics slower than the rest of the apps, go to Developer Options

and enable the 'Force GPU rendering' option. Now, every app, regardless of whether they are updated to use this feature, will be able to.

LIMIT BACKGROUND PROCESSES

If your phone lacks a good amount of RAM or you simply have a lot of RAM-hungry apps running on your device, enabling this option may be beneficial for you. You can use developer options to control the number of processes that can run simultaneously on your device, thereby reducing the amount of RAM gobbled up by it. In Developer Options, select 'Limit background processes' and then choose the number of processes that you think would be optimal to be running at the same time on your device. Select this by keeping in the mind the amount of RAM your device possesses. If you select two processes, the app you are currently running plus two most recent background apps will be kept running while the others will shut down.

FORCE INSTALL APPS TO SD CARD

Many apps on the Play Store do not support being installed on an external memory card (SD card). If your device is low on space, this can quickly become frustrating and you will have

to resort to the process of deleting apps, photos and other items on your device to make room for more integral ones. However, through Developer Options, you can choose to force install all apps to your SD card despite the app not supporting this. Go to Developer Options and enable 'Force allow apps on external'. The device will immediately restart after which every app can be redirected to your microSD card.

NIGHT MODE

If your phone's OS doesn't support dark mode, it can be quite a hassle to individually activate dark mode on every app that supports it. In Android 10, Google finally added Night Mode to Devel-

Dark/Night Mode > Light Mode

oper Options. You can simply toggle it on to activate it on every single app that supports it. Alternatively, you can select 'Always off' instead of 'Always on', if you prefer the light mode. You can also set it to automatic (based on the time of the day). Welcome to the dark side! 🌑
